**Abstract**—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and heart rate reserve (HRR) of sedentary middle-aged men. The subjects were divided into two groups: a control group and a training group. The training group performed a 12-week training program consisting of three sessions per week. The control group did not participate in any training program. The HR and HRR were measured at rest and during exercise at the beginning and end of the 12-week period. The results showed that the training group had a significant decrease in HR and HRR at rest and during exercise compared to the control group. The control group had no significant change in HR and HRR. The results suggest that a 12-week training program can improve the cardiovascular fitness of sedentary middle-aged men.
