

## Eukaryotic Gene Regulation

10. In what two ways is gene regulation in eukaryotes different from gene regulation in prokaryotes?
- Most eukaryotic genes are controlled individually.*
  - Eukaryotic cells have more complex regulatory sequences than those of the lac repressor system.*
11. What is a TATA box? What does a TATA box do?
- It is a short region of DNA that contains a sequence of T and A base pairs. The protein that binds to this site helps position RNA polymerase.*
12. What are transcription factors and what do they do?
- They are DNA-binding proteins that bind to DNA sequences in the regulatory regions of genes and help control gene expression.*
13. Explain how gene regulation makes cell specialization possible.
- It allows particular genes to be expressed in some kinds of cells but not others.*
14. What is microRNA and how is it related to mRNA?
- Small RNA molecules are called microRNA. They attach to certain mRNA molecules and stop them from passing on their protein-making instructions.*
15. Explain how the process of RNA interference works.
- Certain small RNA molecules fold into loops. The Dicer enzyme cuts them into microRNA (miRNA). The strands then separate. An miRNA piece attaches to a cluster of proteins to form a silencing complex. The silencing complex binds to and destroys an mRNA molecule that contains a base sequence complementary to the miRNA. In this way, it blocks gene expression.*
