Netgear User Guide:

Mac User's Guide to Living Wirelessly Brad Miser, 2005 The major force driving people to embrace wireless computing is Wi-Fi. Once dismissed as a fad, Wi-Fi is rapidly becoming ubiquitous in the US and around the world. In 2004 more than half of all laptops sold in the US shipped with Wi-Fi installed. By 2007 most analysts predict that nearly every laptop sold in the US will include Wi-Fi. Nearly 20 million Wi-Fi access points will be sold this year, up 20% from last year. As these numbers grow, prices will continue to fall, making Wi-Fi more attractive to more and more people. By the end of this year there will be more than 40,000 hotspots, public Wi-Fi access points available across the US in hotels, fast food restaurants, cafés, airports, even parks. By 2007 that number will surpass 100,000. From McDonald's to Kinko's to Holiday Inn, Wi-Fi is becoming a killer amenity. Once Wi-Fi networks are in place, they can be used for much more than just Internet access. For example, the AirPort Express allows users to stream iTunes throughout their homes wirelessly. Wi-Fi is being used to network printers, cameras, and ultimately home entertainment devices.

Achieving Collision Avoidance and Fairness in CSMA-based Wireless Mesh Networks Jung Il Choi, 2011 CSMA based wireless mesh networks are vulnerable to collisions Even a single unicast flow can exhibit excessive collisions from hidden terminals Furthermore fairness objectives for single hop networks can cause undesirable behaviors for mesh networks Mesh networks of wireless sensors suffer from undesirable protocol interactions due to these challenges Inter protocol collisions and unfair channel usage between protocols cause the behavior of one protocol to change depending on other protocols These inter protocol interactions complicate the design of large sensor network systems Motivated by these problems this dissertation presents grant to send a novel collision avoidance mechanism for wireless mesh networks Rather than announce packets it intends to send a node using grant to send announces packets it expects to hear others send This dissertation provides evidence that inverting collision avoidance in this way greatly improves wireless mesh performance without significant overhead Grant to send is simple to implement and is compatible with existing hardware Grant to send is also general enough to replace protocol specific collision avoidance mechanisms common to sensor network protocols While these individual mechanisms only avoid intra protocol collisions grant to send provides a MAC mechanism which can address both intra and inter protocol collisions This dissertation also proposes a fairness scheme for mesh networks which can be applied to protocol fairness The fairness scheme combines and modifies traditional flow based fairness techniques such as fair queueing and fair scheduling However the complexities of wireless make these mechanisms insufficient by themselves This dissertation therefore proposes two new mechanisms that address these limitations channel decay and fair cancellation and shows that the fairness scheme can significantly improve protocol fairness Together this dissertation shows that achieving collision avoidance and fairness can make mesh networks perform better more reliable and thus easier to design
