Shape and Shape Changes in Mechanics Michel Frémond,2025-05-09

This book provides an innovative description of motion with large deformations and the possibility of defects and dislocations. The theory is based on the stretch and angular matrices of the polar decomposition allowing convex potentials. Third order gradient theories are required to account for mechanical everyday experiments for instance assemblies of solid structures with different spatial dimensions. Second order gradient theories are required for thermal experiments. Using the principle of virtual power and new convex potentials the position of either solid or fluid structures together with the matrix accounting for the defects and dislocations is computed. Defects and dislocations are present in case an internal stress is large enough. Engineers and scientists active in solid and fluid engineering mathematics and numerics should be aware of this predictive theory. Damage, shape memory alloys, Cosserat materials and surface tension are investigated in this framework.
