Unique Plants & Animals of the Amazon

1. The Amazon rainforest in South America is the largest rainforest in the world. It is home to thousands of species of plants and animals. Each species has adapted over time in order to survive in the rainforest. Sloths, poison dart frogs, and sundew plants are just a few organisms with special adaptations that help them survive in the Amazon.
2. **Hanging Out**
Sloths are mammals that live in the rainforest's trees. They are known for being unusually slow animals, typically moving only a few inches every day. While some people consider them to be lazy, sloths are actually well adapted to their leisurely lifestyle. They do most of their daily activities while hanging upside-down from tree branches, from eating and sleeping to giving birth and raising their young.
3. Sloths might seem like easy targets, given their lack of movement. However, certain adaptations have helped them thrive. For example, three-toed sloths are able to scan their surroundings for predators by turning their heads almost 270 degrees - close to a full circle. In addition, because sloths are so sluggish, they are able to defend themselves if necessary. This plant gives the sloth a greenish color, helping it blend in with the surrounding trees. How do you see that, how do you do it?
4. **Skin with a Sting**
Poison dart frogs are small and colorful, making them a potentially tasty treat for many animals that live in the rainforest. To protect itself, this little frog has developed a frog's skin is poisonous. It didn't get that way on its own, however. Poison dart frogs eat insects like flies, spiders, and ants. Scientists believe that as the frogs eat their prey, they absorb poison from the plants those insects ate. Even though poison some species carry enough venom to kill ten adult men. Most of the frog's predators have learned that its skin is more toxic than tasty. The vibrant colors on the frog's body serve as a reminder to predators to beware.
5. **Hungry Leaves**
The soil of the Amazon generally contains few nutrients. To make up for this, sundew plants take matters into their own hands. Each leaf of this carnivorous plant is covered in sticky hair-like tendrils. The tips of these tendrils are coated with a sticky, sweet liquid, but get stuck. The leaf responds to the insect's touch by moving its other tendrils closer to further grasp it. Unable to escape, the insect suffocates within a few minutes. The plant then digests the insect and absorbs the nutrients from its body. That's one creative way to get food!
