Cell Cycle in Development Jacek Z. Kubiak,2011-06-01 This book focuses on the intersection between cell cycle regulation and embryo development Specific modifications of the canonical cell cycle occur throughout the whole period of development and are adapted to fulfil functions coded by the developmental program Deciphering these adaptations is essential to comprehending how living organisms develop The aim of this book is to review the best known modifications and adaptations of the cell cycle during development The first chapters cover the general problems of how the cell cycle evolves while consecutive chapters guide readers through the plethora of such phenomena The book closes with a description of specific changes in the cell cycle of neurons in the

senescent human brain Taken together the chapters present a panorama of species from worms to humans and of developmental stages from unfertilized oocyte to aged adult *Cell Cycle Control* Tim Humphrey, Gavin Brooks, 2008-02-04

The fundamental question of how cells grow and divide has perplexed biologists since the development of the cell theory in the mid 19th century when it was recognized by Virchow and others that all cells come from cells In recent years considerable effort has been applied to the identification of the basic molecules and mechanisms that regulate the cell cycle in a number of different organisms Such studies have led to the elucidation of the central paradigms that underpin eukaryotic cell cycle control for which Lee Hartwell Tim Hunt and Paul Nurse were jointly awarded the Nobel Prize for Medicine and Physiology in 2001 in recognition of their seminal contributions to this field The importance of understanding the fundamental mechanisms that modulate cell division has been reiterated by relatively recent discoveries of links between cell cycle control and DNA repair growth cellular metabolism development and cell death This new phase of integrated cell cycle research provides further challenges and opportunities to the biological and medical worlds in applying these basic concepts to understanding the etiology of cancer and other proliferative diseases

Progress in Cell Cycle Research Laurent Meijer, Silvana Guidet, Michel Philippe, 2012-12-06 The Progress in Cell Cycle Research series has been conceived to serve as a collection of reviews on various aspects of a fast growing biology field the cell division cycle These reviews do not pretend to cover all aspects of cell

cycle regulation and mechanisms but rather focus on a few topics of particular interest in the recent literature This third volume starts with a broad overview of the diversity of ways by which viruses subdue their host cell cycle chapter 1 Of particular interest in this area is the case of HN which has recently been extensively investigated chapter 2 Although most of our understanding of cell cycle regulation derives from work performed in yeast and animal cells plant models reviewed in chapter 3 for one of the best studied example Arabidopsis are starting to contribute significantly to the cell cycle general picture In mammals the regulation of cell division of two types of tissues the intestine chapter 4 and the developing muscle chapter 5 are investigated in an interesting physiological context Cell division is accompanied by a number of morphological changes One of them organelle transport is starting to be better understood chapter 6 The next few chapter summarise our knowledge of some essential regulators of the cell cycle A still intriguing enzyme casein kinase 2 is reviewed in detail in chapter 7 Some of the most studied cell cycle regulators are certainly the CKI s cyclin dependent kinases inhibitors chapter 8

Cell Cycle Control Michele Pagano,2013-06-29 Addressing the regulation of the eukaryotic cell cycle this book brings together experts to cover all aspects of the field clearly and unambiguously delineating what is commonly accepted in the field from the problems that remain unsolved It will thus appeal to a large audience basic and clinical scientists involved in the study of cell growth differentiation senescence apoptosis and cancer as well as graduates and postgraduates

Nuclear-Cytoplasmic Interactions in the Cell Cycle Gary Whitson,2012-12-02 Nuclear Cytoplasmic Interactions in the Cell Cycle *Molecular Regulation of Nuclear Events in Mitosis and Meiosis* Robert A. Schlegel,Margaret S. Halleck,Potu N. Rao,2013-09-24 Molecular Regulation of Nuclear Events in Mitosis and Meiosis presents papers from researchers in various fields engaged in the scientific study of molecular mechanisms involved in the control of nuclear events in meiotic and mitotic cell activity Various articles in the book discuss a wide range of topics such as the development of cytoplasmic activities that control chromosome cycles during maturation of amphibian oocytes dynamics of the nuclear lamina during mitosis and meiosis role of protein phosphorylation in xenopus oocyte meiotic maturation and cell cycle studies of histone modifications Molecular and cell biologists oncologists and biochemists will find the book invaluable Progress in Cell Cycle Research Laurent Meijer,Silvana Guidet,Lee Vogel,2012-12-06 Now in its second year Progress in Cell Cycle Research was conceived to serve as an up to date introduction to various aspects of the cell division cycle Although an annual review in any field of scientific investigation can never be as current as desired especially in the cell cycle field we hope that this volume will be helpful to students to recent graduates considering a deliation in subject and to investigators at the fringe of the cell cycle field wishing to bridge frontiers An instructive approach to many subjects in biology is often to make comparisons between evolutionary distant organisms If one is willing to accept that yeast represent a model primitive eukaryote then it is possible to make some interesting comparisons of cell cycle control mechanisms between mammals and our little unicellular cousins By and large unicellular organisms have no need for intracellular communication With the exception of the mating

phenomenon in *S. cerevisiae* and perhaps some nutritional sensing mechanisms cellular division of yeast proceeds with complete disregard for neighbourly communication Multicellular organisms on the other hand depend entirely on intracellular communication to maintain structural integrity Consequently elaborate networks have evolved to either prevent or promote appropriate cell division in multicellular organisms Yet as described in chapter two the rudimentary mechanisms for fine tuning the cell division cycle in higher eukaryotes are already apparent in yeast

The Role of TEM4 in Cell Cycle Progression Diogjena Prifti, 2023 The intricate process of eukaryotic cell division relies heavily on the meticulous organization and regulation of various cellular components such as the microtubules and the actin based cortex Proper coordination between these two structures is essential during cell division as failure to do so can result in aneuploidy The role of microtubules is central to cell division particularly during mitosis When cells enter mitosis they undergo a rapid and dynamic remodeling process during which the interphase microtubules disassemble and give rise to shorter more dynamic microtubules emanating from centrosomes Once Nuclear Envelope Breakdown NEBD occurs these microtubules extend and reach the chromosomes forming a bipolar spindle in the midzone of which captured chromosomes will align Upon achieving proper orientation and satisfying the spindle assembly checkpoint cells enter anaphase during which the chromosomes separate The importance of the actin cytoskeleton during the process of mitosis is widely recognized Mitotic entry is characterized by the retraction of the cell margin followed by the rounding up of the cell and the formation of the mitotic spindle CDK1 Cyclin B activation and subsequent translocation into the nucleus are required for this process to occur Upon activation of the complex and its translocation to the nucleus there is a loss of cellular adhesion followed by cell rounding up culminating in mitotic entry The geometry of cell adhesion can also impact the position of the mitotic spindle and the memory of cellular events between cell generations highlighting the significance of the actin cytoskeleton to the mitotic entry process While changes in the dynamics of the microtubule and actin cytoskeletons at the onset of mitosis appear to occur independently recent evidence suggests that there may be crosstalk between the mitotic spindle and the actin cortex through GTPases Matthews et al 2012 RHO family GTPases are activated by guanine nucleotide exchange factors GEFs in response to a plethora of extracellular stimuli regulating several cellular responses such as proliferation differentiation and movement Among the numerous signaling events driven by RHO family GTPases are changes in cell morphology adhesion motility cell cycle progression survival apoptosis and cytokinesis ARHGEF17 also called TEM4 tumor endothelial marker 4 a RHO family GEF specific for RHOA B C has been shown to regulate the interphase cytoskeleton TEM4 has been shown to directly bind actin specifically dynamic newly assembled actin filaments via its N terminus independently of its RHOGEF activity In interphase cells TEM4 and RHOC are proposed to suppress myosin contractility and to control focal adhesion disassembly TEM4 has also been identified as an essential mitotic protein required for the localization of Monopolar Spindle 1 MPS1 at the kinetochore This thesis aims to understand the functions of TEM4 during the cell cycle This study highlights the lack of

specificity of the most commonly used commercial antibody against TEM4 and provides evidence that TEM4 plays a crucial role in mitotic entry chromosome alignment and spindle formation The downregulation of TEM4 prevents cells from rounding up and alters cortical actin in mitotic cells leading to an increased activation of RHOA as shown by quantification of RHOA GTP at the mitotic cortex confirming its function as a regulator of cellular contractility The mitotic phenotypes observed in the absence of TEM4 are found to be partially due to low levels of Cyclin B explaining the observed mitotic delay The expression of exogenous Cyclin B restores cell cycle progression increases the mitotic index and rescues the excessively lagging chromosomes observed in the absence of TEM4 Overall despite the limited literature available on TEM4 this study sheds new light on the importance of TEM4 in the cell cycle and contributes to our understanding of this protein's role in cellular processes

The Mitotic Exit Network: Methods and Protocols Fernando Monje-Casas, Ethel Queralt, 2018-11-23 This detailed book collects the main methodologies used for the analysis of the activity localization and regulation of the components of the Mitotic Exit Network MEN pathway during mitotic exit in *Saccharomyces cerevisiae* as well as for the evaluation of the roles of these proteins in other cellular processes such as the condensation of the rDNA the functionality of the mitotic checkpoints and cytokinesis Budding yeast serves as an ideal model system for dissecting the mechanisms that regulate cell cycle progression and providing new insights into the molecular basis of cell cycle control and thus into the origin of diseases that arise as a consequence of problems during cell division Therefore although this volume concentrates on *Saccharomyces cerevisiae* as a model it also details the implications that the research about the MEN have on our understanding of the mitotic exit process in higher eukaryotes Written for the highly successful Methods in Molecular Biology series chapters include introductions to their respective topics lists of the necessary materials and reagents step by step readily reproducible laboratory protocols and tips on troubleshooting and avoiding known pitfalls Authoritative and practical The Mitotic Exit Network Methods and Protocols will be a valuable reference for cellular and molecular biologists and biochemists as well as for all scientists interested in the study of the regulation of mitotic exit using budding yeast as a model organism

Mitosis, Cytokinesis, and Cell Elongation in the Desmid, Closterium Littorale Jeremy D. Pickett-Heaps, 1970 Some details of interphase cell structure are given At prophase the nuclear envelope breaks down and the nucleolus disperses very small doubled chromosomes generally form a precisely aligned metaphase plate with normal spindle microtubules present 2 plates of chromatids separate during anaphase the spindle becoming invaded by mucilage vesicles Telophase nuclei are initially very hard to discern until they increase in volume Microtubules collect at each pole becoming increasingly focused on one small region containing fine granular material the microtubule center MC The septum an annular ingrowth begins forming at prophase and partitions the cell by telophase At no stage were microtubules involved in this initial cross wall formation At telophase the spindle collapses and as the nuclei move back to the septum increasing numbers of microtubules appear near this cross wall all transversely aligned An annular split deepens down the middle of the

wall material in the septum and the daughter cells begin to expand stretching the new wall the microtubules appearing near the septum now are transformed steadily into typical hooplike wall microtubules but strictly confined to the expanding wall there are none near interphase cell walls Meanwhile the MC has moved to the side of the cell and begins migrating along one of the grooves in the chloroplast a large number of parallel microtubules extends back to the nucleus which becomes increasingly deformed as it begins to extend a long thin protrusion along these microtubules The MC keeps moving along the cell until it lodges in the cleavage developing in the chloroplast Some microtubules extend still further up the cell others appear in the chloroplast cleavage but most ensheathe the nucleus which by now is moving along the cell as a cylindrical structure tightly fitting in the chloroplast groove The nuclear membrane is then drawn up into the deepening chloroplast constriction and when the chloroplast is finally cut in 2 the nucleus takes up its interphase position between the 2 halves While all this is occurring the whole cytoplasm is expanding into the new semicell being created by growth of the wall originally derived from the septum Thus the interphase cell symmetry is reestablished after mitosis These results are discussed in terms of more general phenomena of cell division and morphogenesis
