Kessler, 2010-12-23 From ancient times people have wanted to learn about the sky The stars planets and other heavenly bodies have been observed for centuries and theories have changed as the equipment used has improved Though we now know that the Sun is the center of our solar system and planets and other objects move around it we still have a lot to learn What is a comet made of Why is Pluto now called a dwarf planet What causes a solar eclipse A lunar eclipse This book will help you answer these questions and more Whether you try the experiments and activities in this book for fun or for a school project you ll discover why so many people are fascinated by our solar system

### *A Traveler's Guide to the Stars* Les

Johnson, 2024-06-04 The discovery in the last few decades of thousands of exoplanets orbiting nearby stars has made the age old dream of interstellar travel a newly urgent scientific question Initiatives like NASA s 100 Year Starship and the billionaire funded Breakthrough Starshot are now investigating and developing new technologies that could one day enable humans to explore perhaps even colonize distant solar systems This short accessible book brings readers to the forefront of this new frontier laying out both the challenges to be navigated and the latest thinking and scientific developments that could allow us to overcome them NASA scientist Les Johnson begins by surveying the vast hostile landscape between stars we ll need to traverse an extremely cold mysterious expanse rife with harsh radiation and cosmic dust He describes our first sallies into this sphere with forerunners like the Voyager craft now well on their way into the interstellar medium and new extrasolar probes currently being planned that will venture farther beyond our solar system and launch within our lifetimes He next considers who our interstellar explorers will be first robots followed by humans and what each will entail before delving into the mind boggling science of how one would actually propel an interstellar starship Johnson explains the most promising approaches from antimatter powered rockets to the light filled sails scientists like himself are piloting now and discusses other design challenges to be overcome like power and communications The book closes with a chapter exploring the real science of sci fi and pop culture fixtures like warp drives and wormholes and a conclusion that considers what it will take as a

motion across the night sky It was this motion that allowed ancient civilizations to single them out as different from fixed stars The Observer's Guide to Planetary Motion takes each planet and its moons if it has them in turn and describes how the geometry of the Solar System gives rise to its observed motions Although the motions of the planets may be described as simple elliptical orbits around the Sun we have to observe them from a particular vantage point the Earth which spins daily on its axis and circles around the Sun each year The motions of the planets as observed relative to this spinning observatory take on more complicated patterns Periodically objects become prominent in the night sky for a few weeks or months while at other times they pass too close to the Sun to be observed The Observer's Guide to Planetary Motion provides accurate tables of the best time for observing each planet together with other notable events in their orbits helping amateur astronomers plan when and what to observe Uniquely each of the chapters includes extensive explanatory text relating the events listed to the physical geometry of the Solar System Along the way many questions are answered Why does Mars take over two years between apparitions the times when it is visible from Earth in the night sky while Uranus and Neptune take almost exactly a year Why do planets appear higher in the night sky when they're visible in the winter months Why do Saturn's rings appear to open and close every 15 years This book places seemingly disparate astronomical events into an understandable three dimensional structure enabling an appreciation that for example very good apparitions of Mars come around roughly every 15 years and that those in 2018 and 2035 will be nearly as good as that seen in 2003 Events are listed for the time period 2010-2030 and in the case of rarer events such as eclipses and apparitions of Mars even longer time periods are covered A short closing chapter describes the seasonal appearance of deep sky objects which follow an annual cycle as a result of Earth's orbital motion around the Sun
