This guide describes key concepts and features, as well as commonly used commands and functions for Splunk Cloud and Splunk Enterprise.

Concepts

Events

An **event** is a set of values associated with a timestamp. It is a single entry of data and can have one or multiple lines. An event can be a text document, a configuration file, an entire stack trace, and so on. This is an example of an event in a web activity log

```
173.26.34.223 - - [01/
Mar/2021:12:05:27 -0700] "GET /trade/
app?action=logout HTTP/1.1" 200 2953
```

You can also define transactions to search for and group together events that are conceptually related but span a duration of time. Transactions can represent a multistep business-related activity, such as all events related to a single customer session on a retail website.

Metrics

A metric data point consists of a timestamp and one or more measurements. It can also contain dimensions. A measurement is a metric name and corresponding numeric value. Dimensions

Use the Field Extractor tool to automatically generate and validate field extractions at search-time using regular expressions or delimiters such as spaces, commas, or other characters.

Tags

A **tag** is a knowledge object that enables you to search for events that contain particular field values. You can assign one or more tags to any field/value combination, including event types, hosts, sources, and source types. Use tags to group related field values together, or to track abstract field values such as IP addresses or ID numbers by giving them more descriptive names.

Index-Time and Search-Time

During **index-time** processing, data is read from a source on a host and is classified into a source type. Timestamps are extracted, and the data is parsed into individual events. Line-breaking rules are applied to segment the events to display in the search results. Each event is written to an index on disk, where the event is later retrieved with a search request.

When a **search** starts, referred to as **search-time**, indexed events are retrieved from disk. **Fields** are extracted from the raw text for the event.

Indexes

When data is added, Splunk software parses

Alerts

Alerts are triggered when search results meet specific conditions. You can use alerts on historical and real-time searches. Alerts can be configured to trigger actions such as sending alert information to designated email addresses or posting alert information to a web resource

Additional Features

Datasets

Splunk allows you to create and manage different kinds of **datasets**, including lookups, data models, and table datasets. Table datasets are focused, curated collections of event data that you design for a specific business purpose. You can define and maintain powerful table datasets with Table Views, a tool that translates sophisticated search commands into simple UI editor interactions. It's easy to use, even if you have minimal knowledge of Splunk SPL.

Data Model

A **data model** is a hierarchically-organized collection of datasets. You can reference entire data models or specific datasets within data models in searches. In addition, you can apply data model acceleration to data models. Accelerated data models offer dramatic gains in search performance, which is why they are
