

Exact Path Proven Strong Predictor of North Carolina EOG Test Performance

Research study results indicate high correlations between the Exact Path diagnostic assessment and North Carolina's End-of-Grade (EOG) Tests.

A 2023 study provides evidence that Exact Path diagnostic assessments measure similar knowledge and skills compared to North Carolina's End-of-Grade (EOG) tests. These results support the use of Exact Path as a strong predictor of student performance on

Modeling of Visual Cognition, Body Sense, Motor Control and Their Integrations Hong Qiao,Li Hu,2017-04-25 The interdisciplinary studies between neuroscience and information science have greatly promoted the development of these two fields The achievements of these studies can help humans understand the essence of biological systems provide computational platforms for biological experiments and improve the intelligence and performance of the algorithms in information science This research topic is focused on the computational modeling of visual cognition body sense motor control and their integrations Firstly the modeling and simulation of vision and body sense are achieved by 1 understanding neural mechanism underlying sensory perception and cognition and 2 mimicking accordingly the structures and mechanisms of their signal propagation pathways The achievement of this procedure could provide neural findings for better encoding and decoding visual and somatosensory perception of humans and help robots or systems build humanoid

robust vision body sensing and various emotions Secondly the modeling and simulation of the motor system of the primate are achieved by mimicking the coordination of bones muscles and joints and the control mechanisms of the neural system in the brain and spinal cord This procedure could help robots achieve fast robust and accurate manipulations and be used for safe human computer interaction Finally by integrating them more complete and intelligent systems robots could be built to accomplish various tasks self adaptively and automatically

Neurophysiology in Alzheimer's Disease and Dementia

Davide Vito Moretti, 2016-09-06 Alzheimer's disease AD and dementia are the most common neurodegenerative disorder Since the number of individuals with AD and dementia is expected to increase considerably in the near future reliable treatment and diagnosis are critical EEG and neurophysiological technique could be used as a cost effective screening tool for early detection and diagnosis in the Mild Cognitive Impairment MCI stage The aim in neurophysiology research is to develop signal processing methods that improve the specificity for diagnosing dementia we wish to discover signal features that not only significantly differ in AD patients but also allow us to reliably separate AD patients and control subjects This approach is valuable for clinical purposes as diagnostic tool for dementia and it also more fundamentally contributes to a better understanding of brain dynamics of MCI patients Finally the development of neurophysiological biomarker could be useful in monitoring pharmacological treatments The main focus of this special issue will be on the most recent developments and ideas in the field of EEG and neurophysiology which will enable us to extract features that improve the specificity for diagnosing AD and dementia

Cognitive deficits in schizophrenia and other neuropsychiatric disorders: Convergence of preclinical and clinical evidence Ales Stuchlik, Tomiki Sumiyoshi, 2015-10-23 Neuropsychiatric diseases such as schizophrenia Alzheimer's disease and etc represent a serious medical and socioeconomic problems These diseases are often accompanied by impairments of cognitive function e.g. abstract thinking decision making attention and several types of memory Such deficits significantly disrupt quality of life and daily functioning of patients Cognitive deficits in neuropsychiatric diseases are associated with alterations of brain morphology and function and are often resistant to therapeutic interventions In schizophrenia and related disorders cognitive deficits are also defined as endophenotypes i.e. measurable phenotypes linking these diseases with discrete heritable and reproducible traits This points to the importance of elucidating these endophenotypes in translational studies Animal models may not mimic the full spectrum of clinical symptoms but may act as analogies of particular behaviors or other pathological outcomes They are useful to search for the etiology of particular psychiatric illnesses and novel therapeutics Moreover several behavioral tests to measure cognitive performance in rodents and other species have been implemented The primary focus of the present topic is to provide up to date information on cognitive deficits of neuropsychiatric disorders such as schizophrenia This Research Topic also delineates future directions for translational studies aimed at developing novel treatments interventions of cognitive disturbances

North Carolina Linking Study Northwest Evaluation Association,2014 Recently the Northwest Evaluation Association NWEA completed a study to connect the scale of the North Carolina State End of Grade EOG Testing Program used for North Carolina s mathematics and reading assessments with NWEA s Rausch Interval Unit RIT scale Information from the state assessments was used in a study to establish performance level scores on the RIT scale that would indicate a good chance of success on these tests To perform the analysis we linked together state test and NWEA test results for a sample of 18 730 North Carolina students who completed both exams in the spring of 2013 the term in which the EOG is administered For the spring season labeled current season an Equipercentile method was used to estimate the RIT score equivalent to each state performance level For fall labeled prior season we determined the percentage of the population within the selected study group that performed at each level on the state test and found the equivalent percentile ranges within the NWEA dataset to estimate the cut scores For example if 40% of the study group population in grade 3 mathematics performed below the proficient level on the state test we would find the RIT score that would be equivalent to the 40th percentile for the study population this would not be the same as the 40th percentile in the NWEA norms This RIT score would be the estimated point on the NWEA RIT scale that would be equivalent to the minimum score for proficiency on the state test Documentation about this method can be found on our website Table Sets 1 and 2 show the best estimate of the minimum RIT equivalent to each state performance level for same season spring and prior season fall RIT scores These tables can be used to identify students who may need additional help to perform well on these tests Table Sets 3 and 4 show the estimated probability of a student receiving a proficient score on the state assessment based on that student s RIT score These tables can be used to assist in identifying students who are not likely to pass these assessments thereby increasing the probability that intervention strategies will be planned and implemented These tables can also be useful for identifying target RIT score objectives likely to correspond to successful or proficient performance on the state test Table 5 shows the correlation coefficients between Measured Academic Performance MAP and the state test in each grade These statistics show the degree to which MAP and the state test are linearly related with values at or near 1 0 suggesting a perfect linear relationship and values near 0 0 indicating no linear relationship Table 6 shows the percentages of students at each grade and within each subject whose status on the state test i e whether or not the student met standards was accurately predicted by their MAP performance and using the estimated cut scores within the current study This table can be used to understand the predictive validity of MAP with respect to the EOG
