

ESSENTIAL SKILLS

- 7-1. *Explain how overproduction of offspring, competition and individual variation lead to natural selection.*
- 7-2. *List and describe five evidences for evolution.*
- 7-3. *Use evidence to describe how the five mechanisms of evolution lead to the evolution of a population.*
- 7-4. *Describe and provide an example of how a change in environmental conditions may lead to the formation of new species (speciation) or the extinction of existing species.*

STUDY GUIDE

1. Explain how each of the following relate to Natural Selection:
 - Genetic Diversity – **gives more options for nature to select from.**
 - Overproduction of offspring – **provides more variety and fight for survival; ensures that at least some of the offspring will survive.**
 - Competition – **fight for survival, better “fighters” survive and pass on their genes to the next generation.**
 - Reproduction – **can pass the “better” genes on to the next generation.**
2. What is meant by Fitness in Biology? List at least 4 different environmental factors that affect a species “fitness” or survival.

Ability to survive AND reproduce. Those with “better” traits will be able to reproduce more. Survival depends on food, competition for mate, avoidance of predators, temperature, water, etc.
3. Why is “survival of the fittest” an incomplete description of natural selection? ? **Survival of the fittest does not include the importance of reproduction. Without survival and reproduction, the population does not improve.**
4. Why is it that an individual can not evolve; only populations can evolve? **Evolution involves the change in gene pools over time, and an individual cannot change its genes. Populations can see a shift in the gene frequencies with each generation. This is genetic change, or evolution.**
5. Explain how each of the following are used to support evolutionary relationships among species:
 - Fossils – **evidence of previous life forms through time. Shows that life on Earth has changed in the past.**
 - Biogeography – **Looking at similar species of animals in different parts of the world. Provides evidence of how environmental factors drive evolution of different species.**
 - Molecular Comparisons – **DNA & Protein comparisons show relatedness. Changes in DNA accumulate over time.**
 - Anatomical Comparisons – **Homologous & Vestigial structures show modifications of the same basic body types. Indicates a common/shared ancestry, where the same genes for these structures were preserved in each developing species and passed on.**
 - Embryological Development – **Studying embryos show similar patterns of development among related species. The more closely related the species are, the longer their embryo develop ‘patterns’ each other. Very different species show great differences right away.**
6. Why is it important for scientists to use more than one source of evidence to support evolutionary relationships? Give an example of many sources leading to the same conclusions about evolution.

Multiple evidences and repeatable results lead to accepted theories. Example: Whale evolution from land mammals = fossils, homologous structures, DNA evidence, embryology, biogeography all show the same evolutionary path.
