Unit 1: The Real Number System:

In this section we will first have a brief look at the notion of sets, set notations and set operations.

Definition: A set is any collection into a whole of definite, distinguishable objects. The objects are called elements of the set.

Note: The following are some of the important properties of sets:

(i) A set must be well defined. That is, we must be able to tell what is in the set and what is not.

Example: The set of all good books published in 2015.

This is not a well defined set. The problem is "How good is good?"

(ii) The elements in a set must be distinct. That is, no element is repeated.

(iii) The order in which the elements of a set are listed makes no difference.

Set Notation: We usually name sets using capital letters.

If A is a set, and "a" is an element of "A", we write $a \in A$.

If "a" is not an element of A, we write $a \notin A$.

Example: Let $A = $ Set of integers between 1 and 10.

Then, $2 \in A$ but $10 \notin A$.

Set Description:

(a) **Word Description**: Giving a word description for a set.

Example: The first four letters of the English Alphabet.

(b) **Listing**: Whenever the elements of a set can be easily listed, simply enclose the list by braces.

Example:

(i) The set of vowels in the English Alphabet is the set $A = \{a, e, i, o, u\}$.

(ii) The set of integers between 1 and 10 is the set $B = \{2, 3, 4, 5, 6, 7, 8, 9\}$

Special sets:

(i) **Finite Set**: A set is finite if it contains only finitely many elements. Informally, it means we could finish the counting process.

(ii) **Infinite Set**: A set which is not finite.
