

These problems are not meant to introduce the problems associated with thermochemistry. You should already have been introduced to the concepts in your lecture. These are just problems for extra practice. They are presented in random order, on purpose, to let you practice RECOGNIZING what TYPE of problem is in front of you, so that you know how to approach the problem.

Often you will find it much easier when you can identify the type of problem first.

1. From the following enthalpies of reaction:

calculate ΔH for the reaction of ethylene with F_2 :

2. When a 4.25-g sample of solid ammonium nitrate dissolves in 60.0 g of water in a coffee-cup calorimeter, the temperature drops from 22.0 °C to 16.9°C. Calculate ΔH in (kJ/mol NH_4NO_3) for the solution process $\text{NH}_4\text{NO}_3 (s) \longrightarrow \text{NH}_4^+ (aq) + \text{NO}_3^- (aq)$

Assume that the specific heat of the solution is the same as that of pure water.

3. $\text{CH}_3\text{OH} (g) \longrightarrow \text{CO} (g) + 2\text{H}_2 (g) \quad \Delta H = +90.7 \text{ kJ}$

Calculate the amount of heat transferred when 45.0 g of $\text{CH}_3\text{OH} (g)$ are decomposed by this reaction.

4. Calculate the standard enthalpy change for the following reactions:

substance	ΔH_f° kJ/mol
$\text{SiCl}_4 (l)$	-640.1
$\text{SiO}_2 (s)$	-910.9
$\text{HCl} (aq)$	-167.2
$\text{HCl} (g)$	-92.30
$\text{H}_2\text{O} (g)$	-241.82
$\text{H}_2\text{O} (l)$	-285.83

5. $2\text{Mg} (s) + \text{O}_2 (g) \longrightarrow 2\text{MgO} (s) \quad \Delta H = -1204 \text{ kJ}$

How many kJ of heat are absorbed when 7.50 g of $\text{MgO} (s)$ are decomposed into $\text{Mg} (s)$ & $\text{O}_2 (g)$?

6. Write a balanced equation that corresponds to ΔH_f° for $\text{SO}_2 (g)$.

7. A 440. g quantity of a certain metal is heated to 100.0 °C. It is immediately thrust into 258 g of water that is initially at 25.0°C. The temperature of the metal-water mixture rises to 36.5 °C. What is the specific heat of the metal? Assume the density of the water is 0.998 g /mL and the specific heat capacity of the water is 4.184 J/g.°C.

Quantum-Mechanical Prediction of Thermochemical Data Jerzy

Cioslowski,2006-04-11 For the first time in the history of chemical sciences theoretical predictions have achieved the level of reliability that allows them to val experimental measurements in accuracy on a routine basis Only a decade ago such a statement would be valid only with severe qualifi tions as high level quantum chemical calculations were feasible only for molecules composed of a few atoms Improvements in both hardware performance and the level of sophistication of electronic structure me ods have contributed equally to this impressive progress that has taken place only recently The contemporary chemist interested in predicting thermochemical properties such as the standard enthalpy of formation has at his disposal a wide selection of theoretical approaches differing in the range of app cability computational cost and the expected accuracy Ranging from high level treatments of electron correlation used in conjunction with extrapolative schemes to semiempirical methods these approaches have well known advantages and shortcomings that determine their usefulness in studies of particular types of chemical species The growing number of published computational schemes and their variants testing sets and performance statistics often makes it difficult for a scientist not well versed in the language of quantum theory to identify the method most adequate for his research needs

Experimental Thermochemistry International Union of Pure and Applied Chemistry. Commission on Thermodynamics and Thermochemistry,1956 *Teaching General Chemistry* Mansoor Niaz,2008 The main objective of this monograph is to incorporate history and philosophy of science in the chemistry curriculum in order to provide students an overview of the dynamics of scientific research which involves controversies conflicts and rivalries among scientists that is the humanising aspects of science A major thesis of this book is the parallel between the construction of knowledge by the students and the scientists In looking for this relationship it is not necessary that ontogeny recapitulate phylogeny but rather to establish that students can face similar difficulties in conceptualising problems as those faced by the scientists in the past Given the vast amount of literature on students alternative conceptions misconceptions in science it is plausible to suggest that these can be considered not as mistakes but rather as tentative models leading to greater conceptual understanding Just as scientists resist changes in the hard core of their beliefs by offering auxiliary hypotheses students may adopt similar strategies Conceptual change in science education can thus be conceptualised as building of tentative models that provide greater explanatory power to students understanding

Johnson,2015-05-23 The series Topics in Current Chemistry presents critical reviews of the present and future trends in modern chemical research The scope of coverage is all areas of chemical science including the interfaces

with related disciplines such as biology medicine and materials science The goal of each thematic volume is to give the non specialist reader whether in academia or industry a comprehensive insight into an area where new research is emerging which is of interest to a larger scientific audience Each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole The most significant developments of the last 5 to 10 years are presented using selected examples to illustrate the principles discussed The coverage is not intended to be an exhaustive summary of the field or include large quantities of data but should rather be conceptual concentrating on the methodological thinking that will allow the non specialist reader to understand the information presented Contributions also offer an outlook on potential future developments in the field
