objective variable sets and their reduction to equilibrium and non equilibrium forms Typical reduced fluid spin continua are liquid crystals Prominent nematic examples of these include the Ericksen Leslie Parodi ELP formulation in which material particles are equipped with material unit vectors directors Nematic liquid crystals with tensorial order parameters of rank 1 to n model substructure behavior better and for both classes of these the book analyzes the thermodynamic conditions of consistency Granular solid fluid mixtures are generally modeled by complementing the Boltzmann laws with a balance of fluctuation kinetic energy of the particles The book closes by presenting a full Reynolds averaging procedure that accounts for higher correlation terms e g a k epsilon formulation in classical turbulence However because the volume fraction is an additional variable the theory also incorporates k epsilon equations for the volume fraction
