## Background

### The Respiratory System

A healthy respiratory system is essential to an individual's overall health, and respiratory disease is a common cause of death and disability in the United States. The human respiratory system is a complex system that allows the body to take in oxygen and expel carbon dioxide. The lungs and the primary upper airway respiratory system that performs this function.

The lungs take up a large portion of the thoracic cavity and are partially attached to the surface of the thoracic cavity by a double pleural membrane. The pleural membrane provides a moist surface that allows the lungs to move in the rib cage. The respiratory air is brought in the thoracic cavity through the trachea, which is a large, cartilaginous tube that leads to the lungs. The lungs are composed of two lobes, the right and left lungs, which are separated by the mediastinum. The lungs are covered by a double layer of pleural membrane, which is a thin, moist membrane that allows the lungs to move in the rib cage.

The airway is composed of the trachea and bronchi, which are the main airways that lead to the lungs. The trachea is a large, cartilaginous tube that leads to the lungs. The bronchi are smaller tubes that branch off from the trachea and lead to the lungs. The lungs are composed of two lobes, the right and left lungs, which are separated by the mediastinum. The lungs are covered by a double layer of pleural membrane, which is a thin, moist membrane that allows the lungs to move in the rib cage.
