The Respiratory System

A healthy respiratory system allows an individual to receive oxygen and respiratory substances (nutrients) of the blood into the cells of the body. The function of the respiratory system is to exchange gases (oxygen and carbon dioxide) with the body. The lungs are the primary organ of the respiratory system that performs this function.

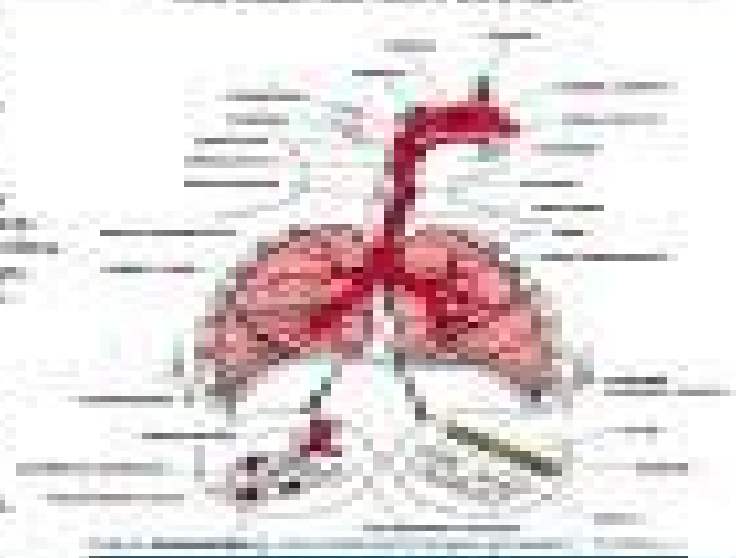

The lungs take up a large portion of the thoracic cavity and are partially attached to the surface of the thoracic cavity by serous pleural membranes. The pleural membranes produce a lubricated surface that allows the lungs to slide in the rib cage. The airway, air is pulled into the thoracic cavity (the lungs) and the thoracic cavity contracts (the lungs are pulled). This may be caused by muscle contraction or expansion.

The amount of oxygen needed by the body (oxygen consumption) is determined by the body's rate of metabolism. Oxygen consumption is directly proportional to the rate of metabolism. The rate of metabolism is determined by cellular respiration, and therefore the rate of metabolism is determined by the rate of oxygen consumption. The rate of metabolism is determined by the rate of oxygen consumption.
