

The Respiratory System

The respiratory system is the system of the body that deals with breathing. When we breathe, the body takes in the oxygen that it needs and removes the carbon dioxide that it doesn't need.

First, the body breathes in the air which is sucked in through the nose and mouth and down the trachea (windpipe). The trachea is a pipe shaped by rings of cartilage. It divides into two tubes called bronchi.

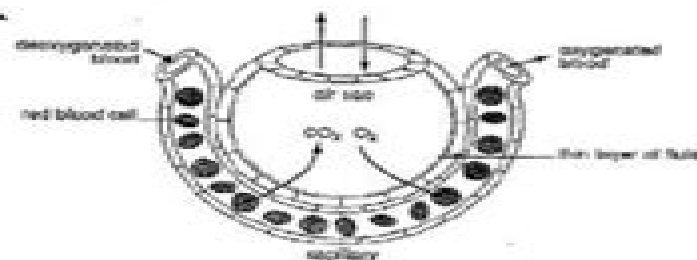

These carry air into each lung. Inside the lungs the tubes divide into smaller and smaller tubes called bronchioles. At the end of each of these tubes are small air balloons called alveoli.

Capillaries, which are small blood vessels with thin walls, are wrapped around these alveolies. The walls are so thin and close to each other that the air easily seeps through. In this way, oxygen seeps through into the

bloodstream and carbon dioxide, in the bloodstream, seeps through into the alveoli. The carbon dioxide is then removed from the body when we breathe out.

The diaphragm is the muscle that controls the breathing process. As the diaphragm flattens it causes the chest to expand and air is sucked in to the lungs. When the diaphragm relaxes, the chest collapses and the air in the lungs is forced out.
