

Section Review 8-1

1. Autotrophs get energy from the sun in the form of light energy. 2. ATP is used to store energy needed for life processes. 3. ADP is converted to ATP by the addition of another phosphate group to an ADP molecule. 4. When ATP is changed to ADP, a phosphate group is removed. The removal of a phosphate group releases energy to the cell. 5. The energy stored in ATP is used for active transport and for movement within cells. 6. They are similar in that they both depend on energy from food. However, autotrophs use the sun's energy to make their own food, while the heterotrophs obtain their energy from the foods they eat. Heterotrophs eat autotrophs or other heterotrophs. 7. heterotroph 8. autotroph 9. heterotroph

Light energy is transferred to the electrons in the chlorophyll molecule, raising the energy of these electrons. These high-energy electrons make photosynthesis work. 8. The production of food will drop because plants do not absorb light well in the green region of the visible spectrum. 9. The plant would have leaves of an orange color. The orange pigment carotene absorbs the orange wavelength of light very poorly, which makes the leaves appear orange. 10. Students' experiments should have controls and manipulated and responding variables, and should test an effect of air pollution on photosynthesis. For example, two plants are placed in different atmospheres, one containing few pollutants and the other containing many pollutants. The students would observe the plants and record data on how the plants thrive or survive in different atmospheres.

Section Review 8-3

1. thylakoid 2. Calvin cycle 3. ATP, NADPH 4. oxygen 5. light-independent 6. stroma 7. Both systems are light dependent. Both systems use light energy to energize electrons. One difference is that water molecules are split in photosystem II, but not in photosystem I. In photosystem II, ADP is converted into ATP. 8. The Calvin cycle is a light-independent reaction and does not require light. It will continue as long as there are ATP and NADPH molecules for the cycle to use. 9. The rate of photosynthesis is affected by water, temperature, and light. Low amounts of water, low temperatures, very high temperatures, and little light will slow the rate, while adequate amounts of water, moderate temperatures, and sunny weather will increase the rate. 10. Students should indicate that they would measure either oxygen or carbon dioxide, and that the rate of increase in oxygen or decrease in carbon dioxide would indicate the rate of photosynthesis.

Chapter Vocabulary Review

1. Adenosine triphosphate is one of the principal chemical compounds that living things use to store energy. 2. A thylakoid is a saclike, photosynthetic membrane found in chloroplasts that contains clusters of chlorophyll. 3. NADP⁺ stands for nicotinamide adenine dinucleotide phosphate, a carrier molecule, which accepts and holds 2 high-energy electrons along with a hydrogen ion. 4. ATP synthase is a protein found in the thylakoid membrane and allows H⁺ ions to pass through it. ATP synthase binds ADP and a phosphate group together to produce ATP. 5. The Calvin cycle uses ATP and NADPH from the light-dependent reactions to produce high-energy sugars. The Calvin cycle takes place in the stroma of chloroplasts and does not require light. 6. An autotroph is an organism that makes its own food. A heterotroph is an organism that obtains energy from the food it consumes. 7. Oxygen is produced in the light-dependent reactions of photosynthesis. 8. Pigments are light-absorbing molecules. Chlorophyll is a pigment. 9. The Calvin cycle does not depend on light and uses ATP and NADPH to produce high-energy sugars. The light-dependent reaction uses energy from sunlight to produce ATP, NADPH, and oxygen. 10. Sugars are formed from carbon dioxide in the Calvin cycle. 11. c 12. e 13. b 14. a 15. d 16. light 17. H₂O 18. CO₂ 19. O₂ 20. sugars

1. Radio waves have the longest wavelength on the electromagnetic spectrum. Gamma rays have the shortest wavelength. 2. Boes can see the beginning of the ultraviolet section of the electromagnetic spectrum where the frequencies are close to those of visible light.

Design an Experiment

Analyze and Conclude 1. The uncovered leaf and the leaves covered with red and blue cellophane contained starch. The leaves covered with black paper and green cellophane contained little or no starch. Students should explain why their prediction was or was not correct. For example, if students predicted that the leaf covered in black paper would not contain starch, they should explain that the black paper prevented any light from reaching the chlorophyll, so the plant could not make starch in photosynthesis. 2. The blue and red cellophane did not affect photosynthesis. The green cellophane reduced the amount of starch produced by the leaf. Students

Photosynthesis Thijs Aartsma, Jörg Matysik, 2008-02-01 Since the first volume on Biophysical Techniques in Photosynthesis Research published in 1996 new experimental techniques and methods have been devised at a rapid pace The present book is a sequel which complements the first volume by providing a comprehensive overview of the most important new techniques developed over the past ten years especially those that are relevant for research on the mechanism and fundamental aspects of photosynthesis The contributions are written by leading scientists in their field The book is divided into 5 sections on Imaging Structure Optical and laser spectroscopy Magnetic resonance and on Theory respectively Each chapter describes the basic concepts of the technique practical applications and some of the scientific results Possibilities and limitations from a technical as well as a scientific point of view are addressed allowing the reader not only to recognize the potential of a particular method for his her own quest but to assess the resources that are required for implementation

Science Interactions Robert W. Avakian, 1995-07-17 **Annual Plant Reviews, Biology of the Plant Cuticle** Markus Riederer, Caroline Muller, 2008-04-15 Annual Plant Reviews Volume 23 A much clearer picture is now emerging of the fine structure of the plant cuticle and its surface the composition of cuticular waxes and the biosynthetic pathways leading to them Studies assessing the impact of UV radiation on plant life have emphasized the role of the cuticle and underlying epidermis as optical filters for solar radiation The field concerned with the diffusive transport of lipophilic organic non electrolytes across the plant cuticle has reached a state of maturity A new paradigm has recently been proposed for the diffusion of polar compounds and water across the cuticle In the context of plant ecophysiology cuticular transpiration can now be placed in the perspective of whole leaf water relations New and unexpected roles have been assigned to the cuticle in plant development and pollen stigma interactions Finally much progress has been made in understanding the cuticle as a specific and extraordinary substrate for the interactions of the plant with microorganisms fungi and insects This volume details the major developments of recent years in this important interdisciplinary area It is directed at researchers and professionals in plant biochemistry plant physiology plant ecology phytopathology and environmental microbiology in both the academic and industrial sectors Carotenoids in Photosynthesis A. Young, G. Britton, 2012-12-06 Significant

developments in recent years have led to a deeper understanding of the role and function of carotenoids in photosynthesis For the first time the biological biochemical and chemical aspects of the role of these pigments in photosynthesis are brought together in one comprehensive reference volume Chapters focus on the photochemistry of carotenoids in light harvesting and photoprotection the nature and distribution of carotenoids in photosynthetic organisms their biosynthesis the herbicidal inhibition of carotenogenesis and the xanthophyll cycle Throughout details are given of the various methodologies used A detailed appendix provides physical data for the major compounds Carotenoids in Photosynthesis is an invaluable reference source for all plant scientists **Biology Ebook** Raven, 2016-05-16 Biology Ebook Fundamentals of Microbiology Jeffrey C.
