

Computer Networking interview questions and answers related to network architectures

Q Can you describe the differences between client-server and peer-to-peer network architectures?

In a client-server architecture, the network is managed by a central server that provides resources and services to client devices. The server is responsible for data storage, processing, and security, while clients send requests to the server to access these resources.

A On the other hand, in a peer-to-peer (P2P) network, each device (peer) can act as both a client and a server. Resources and data are distributed across all peers, allowing direct sharing without a central server. This can lead to easier setup and more resilient networks but may pose challenges in terms of security and data management.

Look for candidates who can clearly differentiate between these architectures and discuss the advantages and disadvantages of each. Ideal responses should mention aspects like scalability, security, and use cases for both architectures.
