

Power enrichment and economy circuit

10 Fuel flows from the float chamber into the power valve chamber through a fuel channel. An air passage is taken from under the throttle plate to the cover of the power diaphragm chamber. At idle and during light-throttle operation, manifold vacuum draws the diaphragm back against spring pressure. The diaphragm pintle is withdrawn from the brass outlet valve and the spring-loaded ball seats to close off the outlet channel (see illustration).

11 Under acceleration and wide-open throttle operation, the vacuum in the manifold is depleted. The diaphragm returns under

spring pressure and the power diaphragm pintle pushes the ball to open the outlet valve. Fuel then flows through the valve and a calibrated jet to supplement the fuel in the primary main well. The fuel level rises in the well and the fuel mixture is enriched.

Secondary action

12 Once the primary throttle valve is about two-thirds-open, the secondary throttle plate will begin to open. At full-throttle, the linkage is arranged so that both throttle plates will be fully open.

13 A progression jet is used to prevent hesitation as the secondary throttle plate commences to open. This jet is similar in

construction and action to the primary idle jet and is often referred to as the secondary idle jet. An emulsified mixture is discharged into the secondary venturi, via progression drillings, at the initial opening of the secondary throttle plate. Once the secondary throttle plate has opened, the action of the secondary main circuit is similar to the primary circuit.

14 At full-load and high engine speeds, even more fuel is required. The velocity of air creates a depression sufficient to raise fuel from the float chamber into a channel. The fuel then passes through a calibrated bushing to the upper section of the secondary air intake. Here it is mixed with a small amount of air from a calibrated air bleed. The emulsified mixture is then discharged into the airstream from a full-load enrichment outlet placed in the barrel.

Choke operation

15 The manual choke is operated by a dash-mounted cable. When the cable is pulled, it operates a lever that pulls the choke flap closed across the primary air intake. Fast idle is achieved with the aid of a curved cam attached to the choke operating lever. An adjustable screw, attached to the throttle lever and butting against the cam, is used to vary the fast idle speed (see illustration).

16 Once the engine has fired, the choke flap must open slightly to weaken the mixture and avoid flooding during idle and light-throttle operation. This is achieved by using manifold vacuum to actuate a diaphragm. A fulcrum lever attached to the diaphragm lever will then push upon the control link connected to the choke flap.

17 During engine warm-up, the cable should be progressively pushed home until the choke flap is fully open.

2 Identification

The Weber identification code is stamped on the carburettor base flange.
