

Week 7

Learning Outcomes

For week 7 you are required to become familiar with the following:-

Structures – Grouping associated data and creating arrays from this.

Structures

Imagine you wanted to write a database program where you would like to store a persons name, their age, their telephone number, their address and their email address. The data would be of different types, but it would need to be associated. All the data refers to the one person, and in database terms would be referred to as a record. This can be achieved using structures.

A structure is defined in C as a collection of variables that can be referenced under one name. Each type of data within the structure is referred to as a member e.g. a persons name would be a member of a structure for a database of customers.

Look at the following example of a structure:

```
struct customer
{
    char name[NAME_LENGTH];
    char address[ADDRESS_LENGTH];
    char email[EMAIL_LENGTH];
    int phone_no;
};
```

This defines a structure called 'customer'. If we want to use this for one single customer then the following format is used:

```
struct customer one_customer;
```

This creates a structure of type customer called one_customer. The following example code shows how a structure can be created and data directly placed into it's members:

```
#include <stdio.h>
#include <conio.h>
```
