### **Technical feasibility study on the chromium recovery from electroplating effluents** Daniel Wiemken, 2014-04-11

Inhaltsangabe Introduction Rapid industrialisation and growth in population over the past two hundred years exert an increasing pressure on natural resources and the environment Billions of tons of controlled and scheduled waste are generated every year by the industrial sector worldwide which is often either pre treated on site or at a licensed contractor prior to disposal in landfills This practice if continued is leading to resource depletion and creates a potentially harmful legacy for future generations In order to move towards a more sustainable development as outlined in the Bruntland Report waste reduction reuse and recycling coupled with pollution prevention measures play an important part to slow down if not reverse this practice Heavy metals such as cadmium mercury lead and chromium are not degradable or renewable like biomass hence if they are to be used in future processes reuse and recycling are the only options At present heavy metals are used in the chemical industry sector for applications ranging from batteries to catalysts and surface coatings and can be found at various concentrations in gaseous liquid or solid waste Chromium is of particular interest owing to its legislative status and unique chemistry Chromium exists in nature primarily in one of two oxidation states There are other chemical oxidation states of chromium which include 0 II IV and V but they are considered transitory compared to more stable Cr III and Cr VI species Hexavalent chromium is a strong oxidizer which can react with DNA causing mutation while the trivalent organically complex form is a dietary supplement to help with proper glucose metabolism weight loss and muscle tone Unlike many other metals Cr VI can combine with oxygen to form water soluble negatively charged anions known as yellow chromate  $\text{CrO}_4^{2-}$  or orange dichromate  $\text{Cr}_2\text{O}_7^{2-}$  which adsorb to positively charged sites in contrast to cationic metal species Therefore hexavalent chromium species are not strongly bonded in many soils under alkaline to slightly acidic conditions for example Thus they can be very mobile in subsurface environment while other metals precipitated out and exert toxic effects on biological systems Various well established methods may be used to treat industrial effluents and contaminated water such as reduction and precipitation reverse osmosis evaporation ion exchange and adsorption While these processes are able to remove

The Congress Arsenic in the Environment offers an international multi and interdisciplinary discussion platform for research and innovation aimed towards a holistic solution to the problem posed by the environmental toxin arsenic with considerable societal impact. The congress has focused on cutting edge and breakthrough research in physical chemical toxicological medical agricultural and other specific issues on arsenic across a broader environmental realm. The Congress Arsenic in the Environment was first organized in Mexico City As2006 followed by As2008 in Valencia Spain As2010 in Tainan Taiwan As2012 in Cairns Australia and As2014 in Buenos Aires Argentina. The 6th International Congress As2016 was held June 19-23 2016 in Stockholm Sweden and was entitled Arsenic Research and Global Sustainability. The Congress addressed the broader context of arsenic research along the following themes: Theme 1 Arsenic in Environmental Matrices and Interactions Air Water Soil and Biological Matrices; Theme 2 Arsenic in Food Chain; Theme 3 Arsenic and Health; Theme 4 Clean Water Technology for Control of Arsenic; Theme 5 Societal issues Policy Studies Mitigation and Management.

Long term exposure to low to medium levels of arsenic via contaminated food and drinking water can have a serious impact on human health and globally more than 100 million people are at risk. Since the end of the 20th century arsenic in drinking water mainly groundwater has emerged as a global health concern. In the past decade the presence of arsenic in plant foods especially rice has gained increasing attention. In the Nordic countries in particular the use of water soluble inorganic arsenic chemicals e.g. chromated copper arsenate CCA as wood preservatives and the mining of sulfidic ores have been flagged as health concern. The issue has been accentuated by discoveries of naturally occurring arsenic in groundwater primarily in the private wells in parts of the Fennoscandian Shield and in sedimentary formations with potentially detrimental effects on public health. Sweden has been at the forefront of research on the health effects of arsenic technological solutions for arsenic removal and sustainable mitigation measures for developing countries. Hosting this Congress in Sweden was also relevant because historically Sweden has been one of the leading producer of As<sub>2</sub>O<sub>3</sub> and its emission from the smelting industries in northern Sweden and has successfully implemented actions to reduce the industrial emissions of arsenic as well as minimizing the use of materials and products containing arsenic in since 1977. The Congress has gathered professionals involved in different segments of interdisciplinary research in an open forum and strengthened relations between academia industry research laboratories government agencies and the private sector to share an optimal atmosphere for exchange of knowledge discoveries and discussions about the problem of arsenic in the environment and catalyze the knowledge generation and innovations at a policy context to achieve the goals for post 2015 Sustainable Development.

**Geotechnics of High Water Content Materials** Tuncer B. Edil, Patrick Joseph Fox, 2000. Reasonable estimates indicate that approximately a billion cubic meters of high water content soil like wastes are

produced annually worldwide and a large portion of these are deposited hydraulically in diked impoundment areas some of which are among the largest earth structures in the world The major problems emanating from this disposal method are the difficulty in dewatering the wastes their low strength and hydraulic conductivity their high compressibility their potential to contaminate the groundwater the stability of the confining dikes and the ultimate reclamation of the disturbed land Following a brief explanation of how many of these wastes are generated quantitative values for key engineering properties are summarized and compared for a wide variety of waste materials and some reference soils Then many concepts that have been applied with success will be presented together with the advantages each offers the difficulties involved in using it and the limitations in our knowledge Discussed briefly will be state of practice developments in mathematical modeling laboratory testing and associated interpretations and material property formulations **Advanced Materials** Ivan A. Parinov, Shun-Hsyung Chang, Vitaly Yu. Domínguez, 2008 Soil contamination is the presence

of man made chemicals or other alteration in the natural soil environment This type of contamination typically arises from the rupture of underground storage tanks application of pesticides percolation of contaminated surface water to subsurface strata leaching of wastes from landfills or direct discharge of industrial wastes to the soil The most common chemicals involved are petroleum hydrocarbons solvents pesticides lead and other heavy metals This occurrence of this phenomenon is correlated with the degree of industrialisation and intensity of chemical usage The concern over soil contamination stems primarily from health risks both of direct contact and from secondary contamination of water supplies Mapping of contaminated soil sites and the resulting cleanup are time consuming and expensive tasks requiring extensive amounts of geology hydrology chemistry and computer modelling skills This book presents the latest research from around the world in this field
