**Phylogenetics:** Study of relationships among species, based on shared features. It is based on the fact that the more shared features two species have, the more closely related they are. Phylogenetic trees show the evolutionary relationships between species. They are based on the study of shared features, such as DNA sequences, protein structures, and morphological traits. Lane, R.W. Crosskey, 1993-07-31 Surprising though it seems the world faces almost as great a threat today from arthropod borne diseases as it did in the heady days of the 1950s when global eradication of such diseases by eliminating their vectors with synthetic insecticides particularly DDT seemed a real possibility Malaria for example still causes tremendous morbidity and mortality throughout the world especially in Africa Knowledge of the biology of insect and arachnid disease vectors is

arguably more important now than it has ever been Biological research directed at the development of better methods of control becomes even more important in the light of the partial failure of many control schemes that are based on insecticide although not all is gloom since basic biological studies have contributed enormously to the outstanding success of international control programmes such as the vast Onchocerciasis Control Programme in West Africa It is a sine qua non for proper understanding of the epidemiology and successful vector control of any human disease transmitted by an arthropod that all concerned with the problem medical entomologist parasitologist field technician have a good basic understanding of the arthropod s biology Knowledge will be needed not only of its direct relationship to any parasite or pathogen that it transmits but also of its structure its life history and its behaviour in short its natural history Above all it will be necessary to be sure that it is correctly identified
