

## **Short Informative Speech on Smoking**

Smoking is regarded as a fashion symbol in young boys. Despite the ill effects of smoking, people still continue to smoke. Many young boys, who start smoking, feel that they look broadminded and liberated if they smoke.

Most often, the teenagers adopt this habit just because of the company they enjoy. Sometimes, they take a puff from their friend's cigar. Later on, they develop the habit of smoking as an indispensable part of their lives. With the passage of time, the followers of this bad habit turn into chain smokers. It must be kept in mind that smoking is a toxic habit that may develop lungs' cancer. Moreover, the other toxic chemicals like arsenic, carbon Monoxide, methane, acetic acid, nicotine, butane and cadmium present in cigarettes are also highly damaging for health.

Currently, cigarette manufacturing companies are doing very well all over the globe. Such manufacturing companies also inscribe warnings on the packets of cigarettes; still people do not pay any heed. On the other hand, every year government increases the price of cigarettes to discourage people using tobacco. Yet smokers go on smoking and prove to be slaves of this bad habit.

The active smokers also harm other people around them known as passive smokers. Here, it is significant on the part of the government to keep a ban on advertisements that allure people to smoke. Moreover, the family members and close friends of the smoker should also play their part to aware the smoker about the bad effects of this habit. Although it requires strong will to stop smoking but once you plan to give up, you can definitely do.

**Weight-of-Evidence for Forensic DNA Profiles** David J. Balding, Christopher D. Steele, 2015-05-11 DNA evidence is widely used in the modern justice system Statistical methodology plays a key role in ensuring that this evidence is collected interpreted analysed and presented correctly This book is a guide to assessing DNA evidence and presenting that evidence in a courtroom setting It offers practical guidance to forensic scientists with little dependence on mathematical ability and provides the scientist with the understanding they require to apply the methods in their work Since the publication of the first edition of this book in 2005 there have been many incremental changes and one dramatic change which is the emergence of low template DNA LTDNA profiles This second edition is edited and expanded to cover the basics of LTDNA technology The author s own open source R code likeLTD is described and used for worked examples in the book Commercial and free software are also covered

*Forensic DNA Trace Evidence Interpretation* Duncan Taylor, Bas Kokshoorn, 2023-05-30 *Forensic DNA Trace Evidence Interpretation* Activity Level Propositions and Likelihood Ratios provides all foundational information required for a reader to understand the practice of evaluating forensic biology evidence given activity level propositions and to implement the

practice into active casework within a forensic institution The book begins by explaining basic concepts and foundational theory pulling together research and studies that have accumulated in forensic journal literature over the last 20 years The book explains the laws of probability showing how they can be used to derive from first principles the likelihood ratio used throughout the book to express the strength of evidence for any evaluation Concepts such as the hierarchy of propositions the difference between experts working in an investigative or evaluative mode and the practice of case assessment and interpretation are explained to provide the reader with a broad grounding in the topics that are important to understanding evaluation of evidence Activity level evaluations are discussed in relation to biological material transferred from one object to another the ability for biological material to persist on an item for a period of time or through an event the ability to recover the biological material from the object when sampled for forensic testing and the expectations of the prevalence of biological material on objects in our environment These concepts of transfer persistence prevalence and recovery are discussed in detail in addition to the factors that affect each of them The authors go on to explain the evaluation process how to structure case information and formulate propositions This includes how a likelihood ratio formula can be derived to evaluate the forensic findings introducing Bayesian networks and explaining what they represent and how they can be used in evaluations and showing how evaluation can be tested for robustness Using these tools the authors also demonstrate the ways that the methods used in activity level evaluations are applied to questions about body fluids There are also chapters dedicated to reporting of results and implementation of activity level evaluation in a working forensic laboratory Throughout the book four cases are used as examples to demonstrate how to relate the theory to practice and detail how laboratories can integrate and implement activity level evaluation into their active casework

**Genes, Language, & Culture History in the Southwest Pacific** Jonathan S. Friedlaender,2007-04-19 The broad arc of islands north of Australia that extends from Indonesia east towards the central Pacific is home to a set of human populations whose concentration of diversity is unequaled elsewhere Approximately 20% of the worlds languages are spoken here and the biological and genetic heterogeneity among the groups is extraordinary Anthropologist W W Howells once declared diversity in the region so Protean as to defy analysis However this book can now claim considerable success in describing and understanding the origins of the genetic and linguistic variation there In order to cut through this biological knot the authors have applied a comprehensive battery of genetic analyses to an intensively sampled set of populations and have subjected these and complementary linguistic data to a variety of phylogenetic analyses This has revealed a number of heretofore unknown ancient Pleistocene genetic variants that are only found in these island populations and has also identified the genetic footprints of more recent migrants from Southeast Asia who were the ancestors of the Polynesians The book lays out the very complex structure of the variation within and among the islands in this relatively small region and a number of explanatory models are tested to see which best account for the observed pattern of genetic variation here The results suggest that a number of commonly used models of evolutionary divergence are overly simple in their assumptions and that often human diversity has accumulated in very complex ways      **House of Commons Debates, Official Report**

*Radiation-induced and oxidative DNA damages* Antonio Monari,Elise Dumont,Chrysostomos Chatgililoglu,2015-10-02 DNA stores and passes the genetic information of almost all living organisms Its molecular structure and their intramolecular interactions are particularly suitable to maximize stability against oxidative stress and UV light absorption Yet the protection and repair strategies are still error prone DNA lesions are produced including the most complex and highly mutagenic ones An important threat to DNA stability comes from photosensitization i e from the dramatic multiplication of radiation induced defects mediated by the presence of organic or organometallic dyes compared to the direct exposure to UVA radiation Moreover the photo induced production of singlet oxygen generates an extremely high oxidative stress on DNA that in vivo normally results in extended cellular apoptosis Elucidating the processes leading to DNA damages from the production of a simple radical entity to deleterious lesions as well as the opportunities of repair by devoted enzymes is a cornerstone towards the development of more efficient protection strategies Sensitization and selective production of DNA lesions can also be exploited to induce the selective apoptosis of cancer cells upon exposition to radiation or to oxidative stress for instance in the field of photodynamic therapy The importance and relevance of the field is witnessed by the impressive amount of high level papers dealing with this complex subject and notably tackling the structural elucidation of DNA and DNA drug adducts the mechanisms of formation of DNA lesions including the precise detection of the final lesion products as well as the influence of the lesions on the DNA stability and dynamics and the consequences on the ease of repair Due to the complexity of the field lying at the frontiers between

chemistry physics and biology multidisciplinary strategies allying modeling and experience are needed This topic aims at giving an extended overview of the current research in the domain with fundamental contribution from the leading groups in the field of DNA reactivity structural characterization photo chemistry and photo physics as well as repair mechanism It will therefore be a fundamental guide for scientists wanting to address the field of DNA lesion and repair but also more generally for researchers working in rational drug design or in the development of biomarkers and medical imaging techniques
