

FORCES IN FLUIDS

Forces in Fluids

- Pressure = Force / Area
- Pressure: A force pushing on a surface

Fluid Pressure

- Fluid is a substance that can flow easily.
 - Scientifically liquids & gases are considered "fluids"
- In fluids, molecules are constantly moving in all directions
- As a molecule moves and collides w/ a surface, it exerts a force on that surface
- All of the forces exerted by the individual molecules are added together to make up the pressure exerted by the fluid.

Air Pressure

- Air pressure is the result of the weight of a column of air pushing down on an area

Variations in Fluid Pressure

- Elevation: the distance above sea level
- As altitude increases, air pressure decreases
- As air pressure decreases, so does density
- As water depth increases, water pressure increases
- Water is 800x more dense than air, so pressure increases dramatically with depth; every 33 feet in depth adds 1 "atmosphere" of pressure

Pascal's Principle

- When force is applied to a confined fluid, and increase in pressure is transmitted equally to ALL parts of the fluid

Archimedes Principle

- The buoyant force of an object is equal to the weight of the fluid displaced by the object
- The buoyant force is opposite (pushes up) to the force of gravity (pulls down)

Bernoulli's Principle

- The pressure exerted by a moving stream of a fluid is less than the pressure of the surrounding fluid
- The faster the fluid moves, the less pressure it exerts on the surface of the object
