

Practical No: 1

Object:

Introduction to different parts and their function of digital or electronic theodolite.

Theory:

The theodolite is the most intricate and accurate instrument designed for the measurement of horizontal and vertical angles up to $10''$ or $20''$, depending upon the least count of the instrument. It is also known as "universal instrument", due to its various uses. The traditional use has been for land surveying, but they are also used extensively for building and infrastructure construction. It consists of a moveable telescope mounted so it can rotate around horizontal and vertical axes and provide angular readouts. These indicate the orientation of the telescope, and are used to relate the first point sighted through the telescope to subsequent sightings of other points from the same theodolite position.

Uses:

The following are the different purposes for which the theodolite is used:

- Measuring horizontal and vertical angles
- Measuring deflection angles
- Measuring magnetic bearings
- Measuring the horizontal distance between two points
- finding the vertical height of an object
- finding the difference of elevation between various points
- For ranging a line
- prolonging survey lines
- Establishing grades
- setting out curves.
