

INTRODUCTION

The positive engine industry's universal acceptance of Tillson's original diaphragm carburetor has resulted in the development, by Tillson engineers, of the "H" Series carburetor.

Designed with a minimum of parts, this lightweight compact carburetor includes an integral fuel pump and throttle control unit. The adjustment-mounting feature allows a wide range of possible applications.

Information contained in the following pages is presented as an aid to understanding construction, operation and servicing of the "H" Series carburetor.

HL SCHEMATIC

Note: On some models a idle pass Air Adjustment Screw (see Fig. 8) Air Adjustment Screw (see Fig. 8) with adjustment (1) has threaded nut (shown) about one turn.

CONSTRUCTION DATA

The "H" Series carburetor is a lightweight, aluminum die cast carburetor composed of four main parts: metering body, main diaphragm cover plate, fuel pump body and drainer cover. The diaphragm carburetor incorporates many of the same type components found in float type carburetor: choke, throttle, idle and main mixture adjustment screws, idle speed screw and idle needle and seat.

Two styles of main mixture adjustment screws are available: "O" ring type and spring loaded packing type. Both types are designed to prevent the fuel passage in sealing the metering chamber and providing adjustment screw rotation.

A special inert, fused in a brass cage, forms a seat for the idle needle. An inert tension spring exerts a pre-determined force on the idle control lever, which holds the needle in its seat.

A metering diaphragm is subjected to engine suction on the metering chamber side and atmospheric pressure on the venturi side. Atmospheric pressure on the venturi side pushes the diaphragm toward the idle control valve, opening the idle needle to allow fuel to enter the metering chamber, from which it is then delivered into the mixing passages.

The venturi side of the metering diaphragm may be vented either directly to the atmosphere, or in the case of the balanced carburetor, may be balanced (internally vented) to the choke bore. The balanced type can be recognized by a hose tube in the choke bore, which is connected externally to the venturi side of the diaphragm. The purpose of internal balance is to offset the venturi or sucking effect of a partially dirty air stream.

Some carburetor metering systems include a full choke type main needle. These can be identified by the brass cage located in the venturi choke bore of the body casting. The full choke valve allows fuel to flow into the mixing passage and prevents air from flowing into the metering chamber.

The movement of the pump diaphragm draws fuel into the fuel chamber and a reverse movement of the diaphragm forces fuel out of the fuel chamber through the idle needle and seat into the main supply channel. Movement is caused by suction from the engine, acting on the diaphragm.

A plastic cover has provision for the cover to the fuel chamber section of the carburetor and can be rotated 180 degrees for any required fuel conversion location. The plastic version of a top-mount screw to insure clean fuel supply to the metering section of the carburetor.

ADJUSTMENT INSTRUCTIONS

To properly adjust carburetor for best performance the engine must be thoroughly warmed.

INITIAL ADJUSTMENTS:

To start a cold engine, first partially close, by turning clockwise, both idle and main adjustment screws. Open main adjustment (counter clockwise) approximately one and one-quarter (1 1/4) turns. Open idle adjustment screw three-quarters (3/4) turn. Back idle speed regulating screw off to counter with throttle stop screw, then turn it inward about one (1) full turn so as to slightly open throttle shutter.

Open fuel line shut off valve, close choke shutter, partly open throttle shutter and pull starting cord. When engine fires, open choke shutter slightly and idle the engine. On air carburetors, then as engine warms, open choke shutter. To start a warm engine it should only be necessary to pull starting cord, if the carburetor is properly adjusted.

FINAL ADJUSTMENTS:

Complete close throttle shutter and needle air speed regulating screw on engine the speed is approximately 1000 RPM for open throttle - 2000 to 2500 RPM for chokeless - then slowly readjust idle adjustment screw to obtain smooth and even engine performance. Fuel starvation may result from setting the idle adjustment low.

DO NOT FORCE ADJUSTMENTS INTO SEATS!
