Low-Carbon Oriented Improvement Strategy for Flexibility and Resiliency of Multi-Energy Systems Yumin Zhang, Lu Zhang, Rufeng Zhang, Hao Wang, Shuai Yao, 2024-09-18 Due to the inherent volatility and randomness the increasing share of energy from renewable resources presents a challenge to the operation of multi energy systems with heterogeneous energy carriers such as electricity heat hydrogen etc These factors will make the systems hard to adjust their supply and demand flexibly to maintain energy balance to ensure reliability Further this hinders the development of a low carbon and economically viable energy system By making full use of the synergistic interaction of generation transmission load demand and energy storage a three fold approach focused on quantifying demand flexibility evaluating supply capabilities and enhancing resilience can unlock the flexibility potential across various sectors of new energy systems This approach provides

an effective means of facilitating the transition from conventional energy systems to low carbon clean energy oriented paradigms However huge challenges arising from renewable energy pose great obstacles to the aforementioned solution pathway The main objectives of this Research Topic are 1 Develop advanced carbon emission accounting and measurement techniques for emerging multi energy systems 2 Design effective methods for predicting renewable electricity generation 3 Proposed efficient methods for quantitative assessment of uncertainty from renewables and loads 4 Put forward advanced evaluation optimization and planning strategies incorporating diverse flexibility resources 5 Design multifaceted market mechanisms and collaborative frameworks balancing economics and low carbon footprint 6 Develop operational control and resilience enhancement techniques for distribution networks under large scale distributed energy integration
