Frommer,R. Baker Kearfott,Wolfram Luther,2004-02-12 Reliable computing techniques are essential if the validity of the

output of a numerical algorithm is to be guaranteed to be correct Our society relies more and more on computer systems
 Usually our systems appear to work successfully but there are sometimes serious and often minor errors Validated
 computing is one essential technology to achieve increased software reliability Formal logic in the definition of data types the
 computer arithmetic in algorithm design and in program execution allows us to guarantee that the stated problem has or
 does not have a solution in an enclosing interval we compute If the enclosure is narrow we are certain that the result can be
 used Otherwise we have a clear warning that the uncertainty of input values might be large and the algorithm and the model
 have to be improved The use of interval data types and algorithms with controlled rounding and result verification capture
 uncertainty in modeling and problem formulation in model parameter estimation in algorithm truncation in operation round off
 and in model interpretation The techniques of validated computing have proven their merits in many scientific and
 engineering applications They are based on solid and interesting theoretical studies in mathematics and computer science

Smartphone-Based 3D Indoor Localization and Navigation Frank Ebner, 2021-01-10 During the last century navigation systems have become ubiquitous and guide drivers cyclists and pedestrians towards their desired destinations While operating worldwide they rely on line of sight conditions towards satellites and are thus limited to outdoor areas However finding a gate within an airport a ward within a hospital or a university's auditorium also represent navigation problems To provide navigation within such indoor environments new approaches are required This thesis examines pedestrian 3D indoor localization and navigation using commodity smartphones A desirable target platform always at hand and equipped with a

multitude of sensors The IMU accelerometer gyroscope magnetometer and barometer allow for pedestrian dead reckoning that is estimating relative location changes Absolute whereabouts can be determined via Wi Fi an infrastructure present within most public buildings or by using Bluetooth Low Energy Beacons as inexpensive supplement The building s 3D floorplan not only enables navigation but also increases accuracy by preventing impossible movements and serves as a visual reference for the pedestrian All aforementioned information is fused by recursive density estimation based on a particle filter The conducted experiments cover both theoretical backgrounds and real world use cases All discussed approaches utilize the infrastructure found within most public buildings are easy to set up and maintain Overall this thesis results in an indoor localization and navigation system that can be easily deployed without requiring any special hardware components
