Performance Modelling and Evaluation of ATM Networks Demetres D. Kouvatsos,2013-04-17 Asynchronous Transfer Mode ATM networks are widely considered to be the new generation of high speed communication systems both for broadband public information highways and for local and wide area private networks ATM is designed to integrate existing and future voice audio image and data services Moreover ATM aims to simplify the complexity of switching and buffer management to optimise intermediate node processing and buffering and to limit transmission delays However to support such diverse services on one integrated communication network it is most essential through careful engineering to achieve a fruitful balance amongst the conflicting requirements of

different quality of service constraints ensuring that one service does not have adverse implications on another Over recent years there has been a great deal of progress in research and development of ATM technology but there are still many interesting and important problems to be resolved such as traffic characterisation and control routing and optimisation ATM switching techniques and the provision of quality of service This book presents thirty two research papers both from industry and academia reflecting latest original achievements in the theory and practice of performance modelling of ATM networks worldwide These papers were selected subject to peer review from those submitted as extended and revised versions out of fifty nine shorter papers presented at the Second IFIP Workshop on Performance Modelling and Evaluation of ATM Networks July 4 7 1994 Bradford University At least three referees from the scientific committee and externally were involved in the selection of each paper
