Physico-chemical Aspects of Textile Coloration Stephen M. Burkinshaw, 2015-11-30 The production of textile materials comprises a very large and complex global industry that utilises a

diverse range of fibre types and creates a variety of textile products As the great majority of such products are coloured predominantly using aqueous dyeing processes the coloration of textiles is a large scale global business in which complex procedures are used to apply different types of dye to the various types of textile material The development of such dyeing processes is the result of substantial research activity undertaken over many decades into the physico chemical aspects of dye adsorption and the establishment of dyeing theory which seeks to describe the mechanism by which dyes interact with textile fibres Physico Chemical Aspects of Textile Coloration provides a comprehensive treatment of the physical chemistry involved in the dyeing of the major types of natural man made and synthetic fibres with the principal types of dye The book covers fundamental aspects of the physical and chemical structure of both fibres and dyes together with the structure and properties of water in relation to dyeing dyeing as an area of study as well as the terminology employed in dyeing technology and science contemporary views of intermolecular forces and the nature of the interactions that can occur between dyes and fibres at a molecular level fundamental principles involved in dyeing theory as represented by the thermodynamics and kinetics of dye sorption detailed accounts of the mechanism of dyeing that applies to cotton and other cellulosic fibres polyester polyamide wool polyacrylonitrile and silk fibres non aqueous dyeing as represented by the use of air organic solvents and supercritical CO₂ fluid as alternatives to water as application medium The up to date text is supported by a large number of tables figures and illustrations as well as footnotes and widespread use of references to published work The book is essential reading for students teachers researchers and professionals involved in textile coloration

John Olmsted, Greg Williams, Robert C. Burk, 2020 Chemistry 4th Edition is an introductory general chemistry text designed specifically with Canadian professors and students in mind A reorganized Table of Contents and inclusion of SI units IUPAC standards and Canadian content designed to engage and motivate readers and distinguish this text from other offerings It more accurately reflects the curriculum of most Canadian institutions Chemistry is sufficiently rigorous while engaging and retaining student interest through its accessible language and clear problem solving program without an excess of material and redundancy

Cosmic-Chemical Bond David A Williams, Thomas W Hartquist, 2015-10-09 Introducing astrochemistry to a wide audience this book describes how molecules formed in chemical reactions occur in a range of environments in interstellar and circumstellar space from shortly after the Big Bang up to the present epoch Stressing that chemistry in these environments needs to be driven it helps identify these drivers and the various chemical networks that operate giving rise to signature molecules that enable the physics of the region to be better understood The book emphasises in a non mathematical way the chemistry of the Milky Way Galaxy and its planet forming regions describes how other galaxies may have rather different chemistries and shows how chemistry was important even in the Early Universe when most of the elements had yet to be formed This book will appeal to anyone with a general interest in chemistry from students to professional scientists working in interdisciplinary areas and non scientists fascinated by the evolving and exciting story of

chemistry in the cosmos *The Three Functional States of Proteins* Timir Tripathi, Vladimir N Uversky, 2024-11-17 The Three Functional States of Proteins explores how structured proteins intrinsically disordered proteins and phase separated proteins contribute to the complexity of cellular life and offers insights into their roles in both health and disease It discusses the latest research findings and highlight groundbreaking discoveries and innovative methodologies used to study these protein states Traditionally the different states of proteins have been defined based on their structures and functions However it is becoming increasingly clear that these criteria alone may not be sufficient to capture the complex and multifaceted properties of these molecules Definitions based on thermodynamics and kinetics are now recognized as potentially more appropriate for comprehensively understanding protein states Emerging evidence indicates that under physiological conditions a majority of proteins possess the capability to exist in and transition between the native droplet and amyloid states These distinct states play crucial roles in various cellular functions influenced significantly by their physicochemical and structural properties The book also considers the interactions among these states and discusses how their internal organization as individual molecules as well as their collective organization as molecular assemblies are stabilized Furthermore it examines the processes by which these states are formed and the cellular functions associated with each specific state The book serves as an introduction to a unique volume that provides comprehensive coverage of these three functional states of proteins The chapters are written by leading global scientists who are actively engaged in research on these specific protein states It presents a broad picture of the current emerging and evolving research on these protein states Given that this book comprehensively addresses both foundational concepts and recent advancements in the field it will appeal a broad spectrum of readers from various academic disciplines **Physics, Optics, and Spectroscopy of**
