Analysis of the mechanical performance of pin-reinforced sandwich structures Mohamed Adli Dimassi, 2019-11-15 The rising demand to reduce fuel consumption and the continuous increase of materials and manufacturing costs has obliged aircraft manufacturers to boost the use of composite materials and to optimise the manufacturing methods Foam core sandwich structures combine the advantages of high bending properties with low manufacturing costs when liquid composite processes are used However the use of foam core sandwich structures is not widespread in aircraft applications due to the better weight specific performance of honeycomb cores and the susceptibility to impact loading In this context pin reinforcements are added to the foam core to improve its mechanical properties and its damage tolerance This work contributes to the understanding of the mechanical behaviour of pin reinforced foam core sandwich structures under static and impact loading Ultrasonic scan and micro computed tomography are used to identify

the different damage modes The effect of very low temperature on the damage behaviour under impact loading is investigated An explicit simulation model to predict the impact response of pin reinforced foam core sandwich structures is also proposed

Molecular Biomineralization Werner E. G. Müller, 2011-08-30 The concept of biomineralization signifies mineralization processes that take place in close association with organic molecules or matrices The awareness that mineral formation can be guided by organic molecules notably contributed to the understanding of the formation of the inorganic skeletons of living organisms Modern electron microscopic and spectroscopic analyses have successfully demonstrated the participation of biological systems in several mineralization processes and prominent examples include the formation of bio silica in diatoms and sponges This insight has already made the application of recombinant technology for the production of valuable inorganic polymers such as bio silica possible This polymer can be formed by silicatein under conditions that cannot be matched by chemical means Similarly the efforts described in this book have elucidated that certain organisms bacteria in deep sea polymetallic nodules and coccoliths in seamount crusts are involved in the deposition of marine minerals Strategies have already been developed to utilize such microorganisms for the biosynthesis and bioleaching of marine deposits Moreover studies reveal that bio polymers enhance the hydroxyapatite formation of bone forming cells and alter the expression of important regulators of bone resorption suggesting a potential for bone regeneration and treatment prevention of osteoporosis
