

Abstract – The authors examined the effects of a 6-week training program on the self-reported health status of older adults. The study was conducted in two phases. In phase one, participants completed a baseline survey. In phase two, participants completed a follow-up survey after completing the training program. The results showed that participants reported improved health status after completing the training program.

Abstract—The authors examined the effects of a 12-week, 100% body weight (BW) resistance training program on muscle strength, body composition, and bone mineral density (BMD) in 10 sedentary, middle-aged women. The program consisted of 3 sessions per week, with each session including 10 sets of 10 repetitions of 10 exercises. The exercises were: bicep curls, tricep extensions, shoulder presses, squats, lunges, deadlifts, back extensions, sit-ups, planks, and bridges. The program was supervised by a certified personal trainer. The authors found that the program significantly increased muscle strength, body composition, and BMD in the women. The program was well-tolerated and had no adverse effects. The authors conclude that a 12-week, 100% BW resistance training program is an effective and safe way to improve muscle strength, body composition, and BMD in sedentary, middle-aged women.
