Wathey, 2022-10-15 Does neuroscience have anything to say about religious belief or the existence of God Some have tried to answer this question but in doing so most have strayed from the scientific method In The Phantom God computational biologist and neuroscientist John C Wathey Ph D tackles this problem head on exploring religious feelings not as the direct perception by the brain of some supernatural realm nor as the pathological misfiring of neurons but as a natural consequence of how our brains are wired Unlike other neurobiological studies of religion and spirituality The Phantom God treats mysticism not as something uniquely human and possibly supernatural in origin but as a completely natural phenomenon that

has behavioral and evolutionary roots that can be traced far back into our vertebrate ancestry Grounded in evolutionary and behavioral biology this highly original and compelling book takes the reader on a journey through the neural circuitry of crying innate knowledge reinforcement learning emotional bonding embodiment interpersonal perception and the ineffable feeling of certainty that characterizes faith Wathey argues that the feeling of God's presence is spawned by innate neural circuitry similar to the mechanism that compels an infant to cry out for its mother In an adult this circuitry can be activated under conditions that mimic the extreme desperation and helplessness of infancy generating the compelling illusion of the presence of a loving powerful and all knowing savior When seen from this perspective the illusion also appears remarkably like one that has long been familiar to neurologists the phantom limb of the amputee spawned by the expectation of the patient's brain that the missing limb should still be there Including a primer on the basic concepts and terminology of neuroscience The Phantom God details the neural mechanisms behind the illusions and emotions of spiritual experience
