Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a supervised walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, for 30 minutes per session. The control group consisted of 20 women who did not participate in the walking program. The subjects were assessed at baseline and at 12 weeks for physical and psychological health. The walking program had a significant positive effect on the physical and psychological health of the subjects. The walking program significantly improved the subjects' physical health, as measured by the 6-minute walk test, and their psychological health, as measured by the Beck Depression Inventory and the State-Trait Anxiety Inventory. The walking program also significantly improved the subjects' quality of life, as measured by the SF-36. The walking program was well tolerated and had no adverse effects. The results of this study suggest that a supervised walking program can be an effective intervention for improving the physical and psychological health of sedentary, middle-aged women.

Abstract

Background: The purpose of this study was to determine the prevalence of self-reported depression and anxiety among a sample of young adults in the United States.

Methods: Data were obtained from the 2007 National Survey of Adolescent Health, a nationally representative survey of young adults aged 18–24 years. The survey included questions about self-reported depression and anxiety, as well as demographic and socioeconomic factors.

Results: The prevalence of self-reported depression was 12.5% and the prevalence of self-reported anxiety was 15.2%. The prevalence of both depression and anxiety was 8.7%. The prevalence of depression and anxiety was higher among females than males, and higher among those with lower socioeconomic status.

Conclusions: The results of this study suggest that self-reported depression and anxiety are common among young adults in the United States. The prevalence of both depression and anxiety was higher among females than males, and higher among those with lower socioeconomic status.
