

Plant Reproduction & Growth.

How much do you know about cell biology?
Answer the following questions.

1. Explain the process of pollination in plants and its significance in plant reproduction.

Answer: Pollination is the transfer of pollen grains from the anther to the stigma of a flower. It can occur through various means, including wind, water, insects, birds, or other animals. Once the pollen reaches the stigma, it travels down the style to reach the ovary, where fertilization takes place. Pollination is vital for plant reproduction as it allows the fusion of male and female gametes, leading to seed formation and the continuation of plant species.

2. Describe the different types of asexual reproduction in plants and provide examples for each.

Answer: Asexual reproduction in plants involves the production of new individuals without the involvement of gametes or fertilization. There are several types of asexual reproduction, including:

- **Vegetative propagation:** This method involves the use of plant parts such as stems, leaves, or roots to develop new plants. Examples include the use of cuttings, runners, and bulbs.
- **Apomixis:** In this form of reproduction, plants produce seeds without fertilization. Some examples include dandelions and blackberries.
- **Budding:** Budding occurs when a small bud or outgrowth forms on the parent plant and develops into a new individual. Yeast and hydra are examples of organisms that reproduce through budding.
