Michie,2020-11-26 Never have financial markets been subjected to a period of change as rapid and extensive as took place from the 1970s onwards In the 1970s global financial markets were controlled by governments compartmentalized along national boundaries and segregated according to the particular activities they engaged in This all disintegrated in the decades that followed under the pressure of market forces global integration and a revolution in the technology of trading One product of this transformation was the Global Financial Crisis of 2008 which exposed the fragility of the new structures created and cast a long shadow that we still live in today The response to that crisis has shaped the global financial system which has been tested once again by the coronavirus pandemic However none of the outcomes of this transformation were

inevitable despite the forces at work They were the product of decisions taken at the time for a multitude of reasons Banks exchanges and regulators were faced with unprecedented challenges and opportunities as a revolution swept away traditional ways of conducting banking the methods used to trade in financial markets and the rules and regulations employed to enforce discipline In this book Randal C Michie provides an authoritative and unrivalled account of this upheaval based on a careful and exhaustive reading of the Financial Times over the last four decades using it to provide a source of material unmatched by any other in terms of depth and coverage By studying what happened and why in real time it is possible to explain the decisions taken that shaped the course of the transformation and its repercussions **The Palgrave**

**Core Concepts of Accounting Information Systems** Mark G. Simkin, Carolyn A. Strand Norman, Jacob M. Rose, 2014-12-08 Knowing how an accounting information systems gather and transform data into useful decision making information is fundamental knowledge for accounting professionals Mark Simkin Jacob Rose and Carolyn S Norman's essential text *Core Concepts of Accounting Information Systems* 13th Edition helps students understand basic AIS concepts and provides instructors the flexibility to support how they want to teach the course *Genomics in Aquaculture to Better Understand Species Biology and Accelerate Genetic Progress* José Manuel Yáñez, Ross Houston, Scott Newman, 2016-09-15 From a global perspective aquaculture is an activity related to food production with large potential for growth Considering a continuously growing population the efficiency and sustainability of this activity will be crucial to meet the needs of protein for human consumption in the near future However for continuous enhancement of the culture of both fish and shellfish there

are still challenges to overcome mostly related to the biology of the cultured species and their interaction with increasingly changing environmental factors Examples of these challenges include early sexual maturation feed meal replacement immune response to infectious diseases and parasites and temperature and salinity tolerance Moreover it is estimated that less than 10% of the total aquaculture production in the world is based on populations genetically improved by means of artificial selection Thus there is considerable room for implementing breeding schemes aimed at improving productive traits having significant economic impact By far the most economically relevant trait is growth rate which can be efficiently improved by conventional genetic selection i e based on breeding values of selection candidates However there are other important traits that cannot be measured directly on selection candidates such as resistance against infectious and parasitic agents and carcass quality traits e g fillet yield and meat color However these traits can be more efficiently improved using molecular tools to assist breeding programs by means of marker assisted selection using a few markers explaining a high proportion of the trait variation or genomic selection using thousands of markers to estimate genomic breeding values The development and implementation of new technologies applied to molecular biology and genomics such as next generation sequencing methods and high throughput genotyping platforms are allowing the rapid increase of availability of genomic resources in aquaculture species These resources will provide powerful tools to the research community and will aid in the determination of the genetic factors involved in several biological aspects of aquaculture species In this regard it is important to establish discussion in terms of which strategies will be more efficient to solve the primary challenges that are affecting aquaculture systems around the world The main objective of this Research Topic is to provide a forum to communicate recent research and implementation strategies in the use of genomics in aquaculture species with emphasis on 1 a better understanding of fish and shellfish biological processes having considerable impact on aquaculture systems and 2 the efficient incorporation of molecular information into breeding programs to accelerate genetic progress of economically relevant traits
