Parallel Computing: On the Road to Exascale G.R. Joubert, H. Leather, M. Parsons, 2016-04-28 As predicted by Gordon E Moore in 1965 the performance of computer processors increased at an exponential rate Nevertheless the increases in computing speeds of single processor machines were eventually curtailed by physical constraints This led to the development of parallel computing and whilst progress has been made in this field the complexities of parallel algorithm design the deficiencies of the available software development tools and the complexity of scheduling tasks over thousands and even millions of processing nodes represent a major challenge to the construction and use of more powerful parallel systems This book presents the proceedings of the biennial International Conference on Parallel Computing ParCo2015 held

in Edinburgh Scotland in September 2015 Topics covered include computer architecture and performance programming models and methods as well as applications The book also includes two invited talks and a number of mini symposia Exascale computing holds enormous promise in terms of increasing scientific knowledge acquisition and thus contributing to the future well being and prosperity of mankind A number of innovative approaches to the development and use of future high performance and high throughput systems are to be found in this book which will be of interest to all those whose work involves the handling and processing of large amounts of data *Input/Output in Parallel and Distributed Computer Systems* Ravi Jain,John Werth,James C. Browne,2012-12-06 Input Output in Parallel and Distributed Computer Systems has attracted increasing attention over the last few years as it has become apparent that input output performance rather than CPU performance may be the key limiting factor in the performance of future systems This I O bottleneck is caused by the increasing speed mismatch between processing units and storage devices the use of multiple processors operating simultaneously in parallel and distributed systems and by the increasing I O demands of new classes of applications like multimedia It is also important to note that to varying degrees the I O bottleneck exists at multiple levels of the memory hierarchy All indications are that the I O bottleneck will be with us for some time to come and is likely to increase in importance Input Output in Parallel and Distributed Computer Systems is based on papers presented at the 1994 and 1995 IOPADS workshops held in conjunction with the International Parallel Processing Symposium This book is divided into three parts Part I the Introduction contains four invited chapters which provide a tutorial survey of I O issues in parallel and distributed systems The chapters in Parts II and III contain selected research papers from the 1994 and 1995 IOPADS workshops many of these papers have been substantially revised and updated for inclusion in this volume Part II collects the papers from both years which deal with various aspects of system software and Part III addresses architectural issues Input Output in Parallel and Distributed Computer Systems is suitable as a secondary text for graduate level courses in computer architecture software engineering and multimedia systems and as a reference for researchers and practitioners in industry

Ultra-Low Energy Domain-Specific

Instruction-Set Processors Francky Catthoor, Praveen Raghavan, Andy Lambrechts, Murali Jayapala, Angeliki Kritikakou, Javed Absar, 2010-08-05 Modern consumers carry many electronic devices like a mobile phone digital camera GPS PDA and an MP3 player The functionality of each of these devices has gone through an important evolution over recent years with a steep increase in both the number of features as in the quality of the services that they provide However providing the required compute power to support an uncompromised combination of all this functionality is highly non trivial Designing processors that meet the demanding requirements of future mobile devices requires the optimization of the embedded system in general and of the embedded processors in particular as they should strike the correct balance between flexibility energy efficiency and performance In general a designer will try to minimize the energy consumption as far as needed for a given performance with a sufficient flexibility However achieving this goal is already complex when looking at the processor in isolation but in reality the processor is a single component in a more complex system In order to design such complex system successfully critical decisions during the design of each individual component should take into account effect on the other parts with a clear goal to move to a global Pareto optimum in the complete multi dimensional exploration space In the complex global design of battery operated embedded systems the focus of Ultra Low Energy Domain Specific Instruction Set Processors is on the energy aware architecture exploration of domain specific instruction set processors and the co optimization of the datapath architecture foreground memory and instruction memory organisation with a link to the required mapping techniques or compiler steps at the early stages of the design By performing an extensive energy breakdown experiment for a complete embedded platform both energy and performance bottlenecks have been identified together with the important relations between the different components Based on this knowledge architecture extensions are proposed for all the bottlenecks
