Burnside,OHIO STATE UNIV COLUMBUS ELECTROSCIENCE LAB.,1979 The Numerical Electromagnetic Code Basic  
Scattering Code is a user oriented computed code for the analysis of the far field patterns of antennas in the presence of  
perfectly conducting metal structures at UHF and above The analysis is based on uniform asymptotic techniques formulated  
in terms of the Geometrical Theory of Diffraction GTD Complicated structures can be simulated by arbitrarily oriented flat  
plates an infinite ground plane and a finite elliptic cylinder A wide range of practical problems can be simulated using these  
shapes For example flat plates can be used to model the superstructure of a ship the body of a truck or the wings and stores  
of an aircraft The finite elliptic cylinder can be used to model a mast or smoke stack of a ship or the fuselage and engines of  
an aircraft This document is designed to give an overall view of the operation of the computer code to instruct a user in how  
to model structures and to show the validity of the code by comparing various computed results against measured data  
whenever available It also describes in detail the input and output data for the code This information should be sufficient for  
most user s to learn how to effectively operate the code Author
