component analysis indicating that the behavioural test can be used to study dog human interaction. Narrow-sense heritability  $h^2$  of the largest principal component related to contact seeking behaviours was estimated to 0.23. This study found a significant genetic basis to the variation seen in human directed contact seeking behaviours recorded in this population. Next in Paper II we collected and genotyped the DNA of 190 of the previously tested beagles with an HD Canine SNP chip. To find genes associated with human directed contact seeking I performed a genome wide association study (GWAS) showing one significant and two suggestive single nucleotide polymorphism (SNP) markers on chromosome 26. The significant SNP is located within a gene named SEZ6L previously associated with autism in human studies. Two adjacent SNPs with suggestive association were found within a gene called ARVCF which has been associated with schizophrenia. To our knowledge this was the first genome wide study to present regions within the dog genome associated with inter species communication in dogs. However these results could have been unique to this beagle population so Paper III aimed to verify our previous findings in additional dog breeds. We tested 100 Labrador retrievers and 61 golden retrievers with the same unsolvable problem task used in Paper I. Their DNA was collected and each individual was genotyped by pyrosequencing on two of the previously identified SNPs. To study the effects of recent selection the Labrador retrievers were divided into two types. The common type is mainly bred and used for dog shows and as a pet while the field type is mainly bred and used for hunting purposes. In this study we found that both markers varied in both dog breeds and was significantly associated with human directed contact seeking behaviours. Allele frequencies differed significantly between Labrador retriever types suggesting that these loci have been affected by recent selection. In conclusion Paper III verifies the results found in Paper II. Finally in Paper IV we investigated the association between dogs human directed social skills and previously known SNP markers in the oxytocin receptor OXTR region. The oxytocin system plays an important role in the formation of social bonds and may therefore also be important in the bond between dogs and humans. Here we hypothesized that dogs receiving intranasal oxytocin respond differently to the hormone depending on the receptor type. To investigate this 60 golden retrievers were genotyped for SNP markers in the OXTR region and tested with the unsolvable problem task used in Paper I and III. An association was found between genotype and social behaviour in response to oxytocin administration. Dogs responded differently to oxytocin treatment depending on OXTR genotype. In summary this thesis contributes to the knowledge on genetic influence of interspecies communication in dogs.
