

Operator E LTE CA (Carrier Aggregation) Feature Test Guide

1 Feature Introduction

3GPP requires that LTE-Advanced networks provide a downlink peak data rate of 1 Gbit/s. However, due to the limited bandwidth of a single carrier, the 1 Gbit/s data rate requirement is hard to meet. To deal with this situation, 3GPP Release 10 introduced carrier aggregation (CA) for LTE-Advanced networks. CA allows aggregation of contiguous or non-contiguous component carriers (CCs) to expand bandwidth to up to 100 MHz.

Related Concept:

PCell

A primary serving cell (PCell) is a cell on which a CA UE camps. In the PCell, the CA UE works in the same way as it does in a 3GPP Release 8 or Release 9 cell. The physical uplink control channel (PUCCH) of the UE exists only in the PCell.

SCell

A secondary serving cell (SCell) is a cell that an eNodeB configures for a CA UE through an RRC Connection Reconfiguration message. This cell works at a different frequency than the PCell and provides the CA UE with more radio resources. In an SCell, there can be only downlink transmission or both downlink and uplink transmission.

CC

Component carriers (CCs) are the carriers that are aggregated for a CA UE.

PCC

The primary component carrier (PCC) is the carrier of the PCell.

SCC

A secondary component carrier (SCC) is the carrier of an SCell.

3GPP defined CA Band combination (refer to 3GPP TR 36.101 section 5.5).
