A chemical change is a process in which a substance is transformed into one or more new substances. This transformation is usually indicated by a change in color, the formation of a precipitate, the release of a gas, or the formation of a new substance with different properties. Examples of chemical changes include burning, rusting, and cooking.

A physical change is a process in which a substance is transformed into one or more new substances, but the chemical composition of the substance remains the same. Examples of physical changes include melting, boiling, and dissolving.
