

# RESPIRATORY SYSTEM PACKET

**1) Taking in oxygen:** The oxygen your body needs has to come from the air- a mixture of many gasses. Your body doesn't need the other gasses from the air you inhale (breathe in). When you exhale (breathe out) most of the other parts of the air leave your body.

Oxygen is needed by your cells to make energy. The process in which your cells use oxygen and sugars to make energy is called respiration. Respiration is different from breathing. Breathing is just movement of air into and out of your lungs. But respiration is the process in the cells that uses oxygen from this air. After respiration happens, your cells release energy that fuels growth and other cell processes.

**2) Getting rid of Carbon Dioxide and Water:** In addition to energy, respiration makes carbon dioxide and water. Your respiratory system gets rid of carbon dioxide and some water through your lungs. \*\*\*Cup your hands over your mouth and breathe into your hands. You will feel your hands become moist. This is the water coming out of your lungs as you exhale (breathe out).

**3) Helping systems working together:** The respiratory system is just one of your body systems that makes respiration possible. Respiration could not happen without the digestive and circulatory systems as well. Your respiratory system brings oxygen into your lungs. Meanwhile, your digestive system absorbs sugars from food. Then, your circulatory system carries both oxygen and sugars to your cells, where respiration happens.
