Learning Target: *DNA Structure & Replication*

I Can... Create a simulated gene segment of DNA and take the segment through the process of replication.

I Will...

- Create a simulated primary segment of a gene representing the nucleotide types within the sequence with assigned colored paperclips.
- Predict and create a complementary strand of DNA using the base pairing rules.
- Unzip and replicate the DNA gene segment explaining the steps of the process.
- Infer and predict what may result from creating an alteration in the nucleotide sequence.

Quick Review:

- Each DNA molecule has a unique structure that makes it different from other DNA molecules (Remember – A chromosome is condensed DNA and segments of DNA are genes.)
- This difference occurs because the sequence of A, T, C, and G vary from one molecule and gene segment to another.

What You Need to Know About DNA Replication:

- To “replicate” DNA means to produce an exact copy of itself. DNA is the only known molecule that can do this regularly – RNA has been known to replicate under laboratory conditions.
- DNA is able to make an exact replica of itself because of the base pairing characteristics stressed earlier (A with T and C with G).
- When DNA makes a duplicate molecule of itself, the two strands unwind.
- After the two strands have pulled apart, new bases (A, T, C, & G) as well as new sugar and phosphate units come into place according to the base pairing rules.
- A comes in opposite of T, and C is opposite of G.
