Written in eight parts, parts 1-4 emphasize application design in VBA focused around the development of a plain Monte Carlo application. Part 5 assesses the performance of VBA for this application and the final 3 emphasize the implementation of a fast and accurate Monte Carlo method for option valuation. Key topics include Fully polymorphic factories in VBA, Polymorphic input and output using the TextStream and FileSystemObject objects, Valuing a book of options, Detailed assessment of the performance of VBA data structures, Theory implementation and comparison of the main Monte Carlo variance reduction methods, Assessment of discretization methods and their application to option valuation in models like CIR and Heston, Fast valuation of Bermudan options by Monte Carlo. Fundamental theory and implementations of lattice and PDE methods are presented in appendices and developed through the book in the exercise streams. Spanning the two worlds of academic theory and industrial practice, this book is not only suitable as a classroom text in VBA in simulation methods and as an introduction to object oriented design, it is also a reference for model implementers and quants working alongside derivatives groups.
