Practice Exercises

- 19.1** What type of operating system is Windows 7? Describe two of its major features.

Answer:

A 32/64 bit preemptive multitasking operating system supporting multiple users. (1) The ability automatically to repair application and operating system problems. (2) Better networking and device experience (including digital photography and video).

- 19.2** List the design goals of Windows 7. Describe two in detail.

Answer:

Design goals include security, reliability, Windows and POSIX application compatibility, high performance, extensibility, portability and international support. (1) Reliability was perceived as a stringent requirement and included extensive driver verification, facilities for catching programming errors in user-level code, and a rigorous certification process for third-party drivers, applications, and devices. (2) Achieving high performance required examination of past problem areas such as I/O performance, server CPU bottlenecks, and the scalability of multithreaded and multiprocessor environments.

- 19.3** Describe the booting process for a Windows 7 system.

Answer:

(1) As the hardware powers on, the BIOS begins executing from ROM and loads and executes the bootstrap loader from the disk. (2) The NTLDR program is loaded from the root directory of the identified system device and determines which boot device contains the operating system. (3) NTLDR loads the HAL library, kernel, and system hive. The system hive indicates the required boot drivers and loads them. (4) Kernel execution begins by initializing the system and creating two processes: the system process containing all internal worker threads, and the first user-mode initialization process: SMSS. (5) SMSS further initializes the system by establishing paging files and loading device

Operating System Concepts Instructors Solution Manual:

Instructors Solutions Manual Mark Hanna, 2001-05-17 **Operating Systems Programming** Stephen J. Hartley, 1995
Operating Systems Programming is designed to give students experience writing programs in a concurrent programming language. Specifically, it shows how to use the SR concurrent programming language to write programs that use semaphores, monitors, message passing, remote procedure calls, and the rendezvous for an operating systems course. The language can also be used for parallel computing in a shared memory multiprocessor or a distributed memory cluster environment. The pedagogical orientation of the text helps students understand concepts more clearly; it describes the SR language, presents some examples of SR programs, and provides numerous programming assignments in the form of open student laboratories. Operating Systems Programming is ideal for undergraduate and graduate students enrolled in concurrent programming and operating systems courses.
