

Optics - The Study of Light

Refraction

Light refracts when passing between two substances at an angle.

Light does not bend as glass that is not yet within water. Bending begins as light enters the water.

Light travels faster in water than in air, so it bends towards the normal as it enters the water.

The refractive index (n) is a measure of how much light bends in a medium.

Reflection

Light reflects off a surface at the same angle.

Normal - an imaginary line 90° perpendicular to a surface.

Angle of Incidence - the angle between the incident ray and the normal.

Angle of Reflection - the angle between the reflected ray and the normal.

Focus

Point at which parallel light rays converge after reflection from a curved surface. Focus is the focal point of a lens.

Concave Mirrors

Concave mirrors focus light rays that are parallel to the principal axis to a point called the focal point. They have a focal length (f).

Convex Mirrors

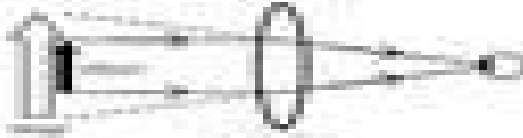

Convex mirrors diverge light rays, making them appear to come from a focal point behind the mirror.

The image is virtual, upright, and smaller than the object.

Lenses

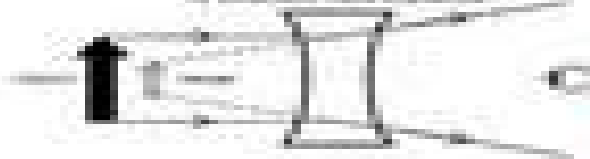

Lenses work by refraction, bending light rays that pass through them.

A converging lens focuses light.

A diverging lens spreads light rays out.

A concave lens diverges light.

A concave lens is divergent, the light rays spread apart.

Image is virtual (upside down)

Concave and convex lenses depend on their shape. If a lens is thicker in the middle, it's a converging lens. If it's thinner in the middle, it's a diverging lens.

Concave Lenses

Optical Systems

Microscopes and telescopes use multiple lenses to magnify objects. Light rays enter from the left, pass through the objective lens, then the eyepiece lens, and exit to the right.

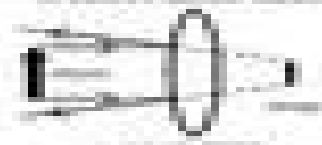

Optical systems can be used to focus light, create images, or change the direction of light rays.

Images

Images are formed by light rays that have been reflected or refracted. They can be real or virtual, upright or inverted, and magnified or reduced.

Ex. The image formed by a convex lens is real, inverted, and magnified. The image formed by a concave lens is virtual, upright, and reduced.

A convex lens focuses light.

A convex mirror is divergent.

A concave mirror focuses light.

A concave mirror is convergent.

Fara sweeps through the centuries from ancient Babylon right up to the latest hi tech experiments in genetics and particle physics illuminating the financial interests imperial ambitions and publishing enterprises that have made science the powerful global phenomenon that it is today She also ranges internationally illustrating the importance of scientific projects based around the world from China to the Islamic empire as well as the more familiar tale of science in Europe from Copernicus to Charles Darwin and beyond Above all this four thousand year history challenges scientific supremacy arguing controversially that science is successful not because it is always right but because people have said that it is right H.
