Differential Operators and Integral Functionals V.V. Jikov,S.M. Kozlov,O.A. Oleinik,2012-12-06 It was mainly during the last two decades that the theory of homogenization or averaging of partial differential equations took shape as a distinct mathematical discipline This theory has a lot of important applications in mechanics of composite and perforated materials filtration disperse media and in many other branches of physics mechanics and modern technology There is a vast literature on the subject The term averaging has been usually associated with the methods of non linear mechanics and ordinary differential equations developed in the works of Poincare Van Der Pol Krylov Bogoliubov etc For a long time after the works of Maxwell and Rayleigh homogenization problems for partial differential equations were being mostly considered by specialists in physics and mechanics and were staying beyond the scope of mathematicians A great deal of attention was given to the so called disperse media which in the simplest case are two phase media formed by the main homogeneous

material containing small foreign particles grains inclusions Such two phase bodies whose size is considerably larger than that of each separate inclusion have been discovered to possess stable physical properties such as heat transfer electric conductivity etc which differ from those of the constituent phases For this reason the word homogenized or effective is used in relation to these characteristics An enormous number of results approximation formulas and estimates have been obtained in connection with such problems as electromagnetic wave scattering on small particles effective heat transfer in two phase media etc
