The Meiotic System Bernard John, Kenneth R. Lewis, 2012-12-06 Introduction When the study of heredity and variation first came to be treated as a scientific subject and this one must remember was only just over a hundred years ago there was an unfortunate separation between the disciplines of cytology and experimental breeding This separation was based partly on a lack of understanding and partly on a lack of the desire to understand Even WILLIAM BATESON the first apostle of mendelism in England had a blind spot for cytology and for many years dogmatically refused to believe that MENDEL'S determinants were transmitted and distributed by the chromosomes This separation between cytology and experimental breeding is one which persists in a measure even today simply because there are two quite different though complementary techniques available for the study of heredity and variation On the one hand one can study directly the structure and behaviour of the actual vehicles which transmit the genetic determinants from one generation to the next This is the method employed by those who study genetics through a microscope The alternative method is that used by the experimental breeder who in default of being able to watch the hereditary factors segregate from each other directly is obliged to examine the constitution of the germ cells indirectly by sampling and usually at random the products of a controlled mating

Folia Biologica ,2003 [Omics in Seed Development: Challenges and Opportunities for Improving of Seed Quality and Yield in Model and Crop Plants](#) Daoquan Xiang, Zhaorong Hu , Raju Datla, 2025-03-06 Seed development

represents an important phase of the life cycle in sexually reproducing plant species A seed is a complex organ system of three components the embryo that contributes to germline continuity endosperm for nourishment and the seed coat for protection The developmental programs and the associated events that culminate in the production of a mature seed are highly complex and require precisely coordinated integration of the genetic molecular biochemical metabolic and physiological pathways and their interactions with environmental cues Research advances in seed development using model and crop species such as Arabidopsis rice maize wheat and Brassica species have uncovered several key genes and pathways that regulate the cell and tissue specification differentiation and growth programs The key findings from these studies are helping to develop a framework for advancing the knowledge and understanding of the process and the underpinning molecular mechanisms of an embryo endosperm and seed coat development However knowledge gaps still exist in understanding the regulating networks and metabolic programs involved in defining several important seed traits associated with seed quality and yield especially in crop plants Continued rapid advances in omics technologies have contributed to the development of several critical tools for performing genome epigenome transcriptome proteome and metabolome studies and their applications in seed development Bioinformatics and computational tools are also playing important contributions in the large scale genome wide systems level analysis modeling and predictions to identify and characterize the underpinning mechanisms that support seed formation A holistic understanding of the complexities and interactions that drive seed development is becoming increasingly possible with the application of omics tools to decipher gene protein and metabolite networks In the proposed Research Topic we highlight current advances in genomics proteomics lipidomics metabolomics metagenomics transcriptomics and phenomics studies of seed development in both model and crop species We aim to further elucidate how these key genetic regulators and pathway genes act together to control cell division patterning differentiation and storage reserve accumulation during seed development how these critical processes coordinate to define the seed as a whole and how the genetic and regulatory networks function to generate tremendous natural diversity in the size number and compositional aspects of plant seeds

Glossary of Genetics and Cytogenetics R. Rieger, A. Michaelis, M.M. Green, 2012-12-06 In preparing the new completely revised edition of this glossary which in the meantime has been translated into Russian and Polish we have attempted to include the most important new terms and to revise the text in those cases where new data demanded it As a result about fifty percent of the text is completely rewritten Once more we have tried to provide material suitable and usable both for students and research workers Accordingly depending upon our evaluation some terms have been simply defined others have been described at some length even to the extent of providing experimental data Wherever possible synonymy and redundancy have been pointed out and in the interest of historical accuracy the individual responsible for introducing a particular term or concept listed with the specific paper included in the literature citations Cross references between related terms are designated by an arrow before each relevant term To keep the book as far as possible to a reasonable size the terms carried over from the earlier edition have once more been critically selected and where necessary revised In spite of these efforts a certain increase in volume was unavoidable We hope that the new edition will once more prove useful to a wide audience and enjoy the same cordial reception as the earlier ones Comments and suggestions from the reviewers and users of the earlier editions have contributed significantly to the revision
