Photogrammetry of a 5m Inflatable Space Antenna with Consumer Digital Cameras Richard S. Pappa, 2000 This paper discusses photogrammetric measurements of a 5m diameter inflatable space antenna using four Kodak DC290 2 1 megapixel digital cameras The study had two objectives 1 Determine the photogrammetric measurement precision obtained using multiple consumer grade digital cameras and 2 Gain experience with new commercial photogrammetry software packages specifically PhotoModeler Pro from Eos Systems Inc The paper covers the eight steps required using this hardware software combination The baseline data set contained four images of the structure taken from various viewing directions Each image came from a separate camera This approach simulated the situation of using multiple time synchronized cameras which will be required in future tests of vibrating or deploying ultra lightweight space structures With four images the average measurement precision for more than 500 points on the antenna surface was less than 0 020 inches inplane and approximately 0 050 inches out of plane
