✓ Exclusively available on IvyPanda

## Introduction

Photosynthesis is the process by which plants assemble carbon-based compounds which are the building blocks and energy stores of life. Plants first entrap sunlight energy and convert it to a chemical energy in ATP molecules which are in form of bonds. ATP brings energy to reactions where glucose is formed from water and carbon dioxide. To finish, glucose molecules are combined to form starch and other molecules. Oxygen is also produced during photosynthesis which is released in to the atmosphere (Koning, 1994, p. 1). The process of photosynthesis is summarized in the equation below;

Aerobic respiration is a procedure of cellular respiration that utilizes oxygen to split molecules to release electrons and form energy (Gregory, 2006, p. 2). In this process adenosine triphosphate (ATP) is produced which is liable for storing up and transporting most energy to other body cells. Aerobic respiration has two by-products which are water and carbon dioxide. It usually involves three main stages of reactions glycolysis which include the Krebs's cycle and electron transport phosphorylation. The equation below is a summary of aerobic respiration;

## How the two processes are linked between plants and animals based on the reactants and products of both pathways

The two processes are the life blood of plants and animals. These processes link in the way that the by-products of one process are used as the raw materials of the other.

Chemical Research on Plant Growth Théodore de Saussure, 2013-03-12 Recherches Chimiques sur la Végétation was a seminal work in the development of the understanding of photosynthesis and plant chemistry The original publication which

was the first concise summation of the basics of plant nutrition was a landmark in plant science It was twice translated into German during the nineteenth century but no English translation has been published This translation will interest those in the plant chemical agricultural and soil sciences and the history of science who find English more accessible than French or German and who wish to learn more about the early research on photosynthesis and plant science A further note about the translation This project is more than just a translation because it includes an extensive introduction as well as notes that provide explanations for archaic terminology and other background material In the twentieth century eminent photosynthesis researcher Eugene Rabinowitch described *Recherches Chimiques sur la Végétation* as the first modern book on plant nutrition Historian of chemistry Henry Leicester called the book a classic noting that the first important generalization about biochemistry in the nineteenth century came from it Plant physiologist P E Pilet stated that the book laid the foundations of a new science phytochemistry Soil scientist E Walter Russell attributed to de Saussure the quantitative experimental method which more than anything else made modern agricultural chemistry possible Chemist Leonard K Nash stated that de Saussure brought the studies of plant nutrition begun by Priestley Ingen Housz and Senebier close to completion finishing the basic experimental work and providing a convincing theoretical interpretation of the field and also opened up new vistas of experiment and thought In the two centuries since *Recherches Chimiques sur la Végétation* was published luminaries in various branches of science including plant biology chemistry and soil science have consistently praised it highly In the nineteenth century noted botanist Alphonse de Candolle and equally noted plant physiologist Julius von Sachs expressed great admiration for it Although de Saussure's ideas were forgotten for a time famed chemist Justus von Liebig who invented artificial fertilizer rediscovered them in the 1840s and brought them to the attention of the agricultural community stressing their importance for increasing crop yields
